## 1. INTRODUCTION AND OVERVIEW OF RELIABILITY AND VALIDITY EVIDENCE

The Idaho Department of Education (“the Department”) implemented the Idaho Standards Achievement Test (ISAT) in Science for operational use starting in the 2021–2022 school year. The ISAT in Science replaced the grade 7 science assessment and the high school end-of-course (EOC) biology and chemistry assessment. The ISAT in Science is administered online to grades 5, 8, and 11 using an adaptive test design. Accommodated versions are available for each grade, including braille and large-print Data Entry Interface (DEI) forms. Spanish-language versions of the tests are also available. Table 1 shows the complete list of tests for the operational test administration in spring 2024.

*Table 1. Spring 2024 Assessment Modes*

Language/Format	Assessment Mode	Grade
English	Online	5, 8, & 11
Spanish	Online	5, 8, & 11
English/Data Entry Interface (DEI) <sup>a</sup>	Paper	5, 8, & 11
English/Braille <sup>b</sup>	Paper	5, 8, & 11

*Note.* <sup>a</sup>Large-print forms in their paper format were entered into DEI. <sup>b</sup>Braille forms in their paper format were also entered into DEI.

Given the intended uses of these tests, both reliability evidence and validity evidence are necessary to support appropriate inferences of student academic achievement from the ISAT in Science scores. The analyses to support reliability and validity evidence that are reported in this volume were conducted based on test results for students whose scores were reported, including those taking the online English-language version and the accommodated versions of the ISAT in Science.

The purpose of this report is to provide empirical evidence that will support a validity argument for the uses of and inferences from the ISAT in Science. This volume addresses the following five topics:

- **Reliability.** The reliability estimates are presented by grade and demographic subgroup. This section also includes conditional standard errors of measurement (CSEM), classification accuracy, and consistency results by grade.
- **Content Validity.** This section presents evidence showing that all students’ tests were constructed to measure the Idaho State Science Standards with a sufficient number of items targeting each area of the test blueprint.
- **Internal Structure Validity.** Evidence is provided regarding the internal relationships among the subscale scores to support their use and to justify the item response theory (IRT) measurement model. This type of evidence includes observed and disattenuated Pearson correlations among discipline scores per grade. As explained in detail in Volume 1, Annual Technical Report, the IRT model is a multidimensional model, with an overall dimension representing proficiency in science and nuisance dimensions that consider within-item

local dependencies among scoring assertions. In this volume, evidence is provided with respect to the presence of item cluster effects. Additionally, confirmatory factor analysis was used to evaluate the fit of the IRT model and to compare it with alternative models, including models with a simpler internal structure (e.g., unidimensional models) and models with a more elaborate internal structure.

- **Relationship of Test Scores to External Variables.** Evidence of convergent and discriminant validity is provided using observed and disattenuated subscore correlations, both within and across subjects.
- **Test Fairness.** Fairness is an explicit concern during item development. Items are developed following the principles of universal design. Universal design removes barriers to provide access for the widest range of students possible. Test fairness is further monitored statistically using differential item functioning (DIF) analysis in tandem with content reviews by specialists.

## 1.1 RELIABILITY

The term *reliability* refers to consistency in test scores. Reliability can be defined as the degree to which individuals' deviation scores remain relatively consistent over repeated administrations of the same test or alternate test forms (Crocker & Algina, 1986). For example, if a person takes the same or parallel tests repeatedly, they should receive consistent results. The reliability coefficient refers to the ratio of true score variance to observed score variance:

$$\rho_{XX'} = \frac{\sigma_T^2}{\sigma_X^2}.$$

Another way to view reliability is to consider its relationship with the standard errors of measurement (SEM)—the smaller the standard error, the higher the precision of the test scores. For example, classical test theory assumes that an observed score ( $X$ ) of an individual can be expressed as a true score ( $T$ ) plus some error ( $E$ ),  $X = T + E$ . The variance of  $X$  can be shown to be the sum of two orthogonal variance components:

$$\sigma_X^2 = \sigma_T^2 + \sigma_E^2.$$

Returning to the definition of reliability as the ratio of true score variance to observed score variance, we can arrive at the following theorem:

$$\rho_{XX'} = \frac{\sigma_T^2}{\sigma_X^2} = \frac{\sigma_X^2 - \sigma_E^2}{\sigma_X^2} = 1 - \frac{\sigma_E^2}{\sigma_X^2}.$$

As the fraction of error variance to observed score variance tends to zero, the reliability then tends to 1. The classical test theory SEM, which assumes a homoscedastic error, is derived from the classical notion expressed above as  $\sigma_X \sqrt{1 - \rho_{XX'}}$ , where  $\sigma_X$  is the standard deviation of the scaled score, and  $\rho_{XX'}$  is a reliability coefficient. Based on the definition of reliability, this formula can be derived as follows:

$$\rho_{XX'} = 1 - \frac{\sigma_E^2}{\sigma_X^2},$$

$$\frac{\sigma_E^2}{\sigma_X^2} = 1 - \rho_{XX'},$$

$$\sigma_E^2 = \sigma_X^2(1 - \rho_{XX'}), \text{ and}$$

$$\sigma_E = \sigma_X \sqrt{(1 - \rho_{XX'})}.$$

In general, the SEM is relatively constant across samples, as the group dependent term,  $\sigma_X$ , can be shown to cancel out:

$$\sigma_E = \sigma_X \sqrt{(1 - \rho_{XX'})} = \sigma_X \sqrt{(1 - (1 - \frac{\sigma_E^2}{\sigma_X^2}))} = \sigma_X \sqrt{\frac{\sigma_E^2}{\sigma_X^2}} = \sigma_X \times \frac{\sigma_E}{\sigma_X} = \sigma_E.$$

This shows that the SEM in the classical test theory is assumed to be a homoscedastic error, irrespective of the standard deviation of a group.

In contrast, the SEMs in IRT vary over the ability continuum. These heterogeneous errors are a function of a test information function (TIF) that provides different information about test takers depending on their estimated abilities.

Because the TIF indicates the amount of information provided by the test at different points along the ability scale, its inverse indicates the lack of information at different points along the ability scale. This lack of information is the uncertainty, or the measurement error, of the score at various score points. See Section 3, Reliability, of this volume, for the derivation of heterogeneous measurement errors in IRT and a discussion of how these errors are aggregated over the score distribution to obtain a single, marginal, IRT-based reliability coefficient.

## 1.2 VALIDITY

The term *validity* refers to the degree to which “evidence and theory support the interpretations of test scores entailed by proposed uses of tests” (American Educational Research Association [AERA], American Psychological Association [APA], & National Council on Measurement in Education [NCME], 2014). Messick (1989) defines validity as “an integrated evaluative judgment of the degree to which empirical evidence and theoretical rationales support the adequacy and appropriateness of inferences and actions based on test scores or other modes of assessment” (p. 13). Both definitions emphasize evidence and theory to support inferences and interpretations of test scores. The *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014) suggest five sources of validity evidence that can be used in evaluating a proposed interpretation of test scores. When validating test scores, these sources of evidence should be considered carefully.

The first source of evidence for validity is the relationship between the test content and the intended test construct (see Section 4, Evidence of Content Validity, of this volume). For test score inferences to support a validity claim, the items should be representative of the content domain, and the content domain should be relevant to the proposed interpretation of test scores. To determine content representativeness, diverse panels of content experts conduct alignment studies, in which experts review individual items and rate them based on how well they match the test specifications or cognitive skills required for a construct (see Section 4.2, Independent Alignment

Study, of this volume for the results of an independent alignment study; and Volume 2, Test Development, for details on the item development process).

Technology-enhanced items should be examined to ensure that no construct-irrelevant variance is introduced. If some aspect of the technology impedes or advantages a student in their responses to items, this could affect item responses and inferences regarding abilities on the measured construct (see Volume 2, Test Development). To minimize construct irrelevance due to students' lack of familiarity with test-taking protocols or testing environment, computer-based training tests were made available prior to test administration and throughout the testing window. The training tests were designed to familiarize students with the system, functionality, and item types and the items provided a grade- and subject-specific testing experience. For more details on the ISAT training tests, see Section 3.2, Test Administration Resources of Volume 5.

The second source of validity evidence is based on “the fit between the construct and the detailed nature of performance or response actually engaged in by examinees” (AERA, APA, & NCME, 2014, p. 12). This evidence is collected by surveying test takers about their performance strategies or responses to specific items. Because items are developed to measure specific constructs and intellectual processes, evidence that test takers have engaged in relevant performance strategies to correctly answer the items supports the validity of the test scores.

The third source of evidence for validity is based on *internal structure*: the degree to which the relationships among test items and test components relate to the construct on which the proposed test scores are interpreted. Possible analyses to examine internal structure are dimensionality assessment, goodness-of-model-fit to data, and reliability analysis (see Section 3, Reliability; and Section 5, Evidence of Internal-External Structure, of this volume for details). In addition, it is important to assess the degree to which the statistical relation between items and test components is invariant across groups. DIF analysis can be used to assess whether specific items function differently for subgroups of test takers (see Volume 1, Annual Technical Report).

The fourth source of evidence for validity is the relationship of test scores to external variables. The *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014) divides this source of evidence into three parts: (1) convergent and discriminant evidence; (2) test-criterion relationships; and (3) validity generalization. Convergent evidence supports the relationship between the test and other measures intended to assess similar constructs. Conversely, discriminant evidence delineates the test from other measures intended to assess different constructs. To analyze both convergent and discriminant evidence, a multitrait-multimethod matrix can be used. Additionally, test-criterion relationships indicate how accurately test scores predict criterion performance. The degree of accuracy depends mainly on the test's purpose, such as classification, diagnosis, or selection. Test-criterion evidence is also used to investigate predictions of favoring different groups. Due to construct underrepresentation or construct-irrelevant components, the relation of test scores to a relevant criterion may differ from one group to another. Furthermore, validity generalization is related to whether the evidence is situation-specific or can be generalized across different settings and times. For example, sampling errors or range restriction may need to be considered in order to determine whether the conclusions of a test can be assumed for the larger population. Convergent and discriminant validity evidence are discussed in Section 5.2, Convergent and Discriminant Validity, of this volume.

The fifth source of validity evidence is the intended and unintended consequences of test use, which should be included in the test validation process. Determining the validity of the test should depend upon evidence directly related to the test; this process should not be influenced by external factors. For example, if an employer administers a test to determine hiring rates for different groups of people, an unequal distribution of skills related to the measurement construct does not necessarily imply a lack of validity for the test. However, if the unequal distribution of scores is in fact due to an unintended, confounding aspect of the test, this *would* interfere with the test's validity. As described in Volume 1, Annual Technical Report, and in this volume, test use should align with the intended purpose of the test.

Supporting a validity argument requires multiple sources of validity evidence. This enables one to evaluate whether sufficient evidence has been presented to support the intended uses and interpretations of the test scores. Thus, determining the validity of a test first requires an explicit statement regarding the intended uses of the test scores and, subsequently, evidence that the scores can be used to support these inferences.

## **2. PURPOSE OF THE IDAHO STANDARDS ACHIEVEMENT TEST IN SCIENCE**

The primary purpose of the Idaho Standards Achievement Test (ISAT) Comprehensive Assessment System is to yield accurate information on students' achievement of Idaho's education standards. The ISAT in Science measures the science knowledge and skills of Idaho students in grades 5, 8, and 11. The Department provides an overview of the science assessment at <https://idaho.portal.cambiumast.com/science-assessments.html>. The ISAT in Science assesses the learning objectives described by the Idaho State Science Standards <sup>1</sup> available at: <https://www.sde.idaho.gov/academic/science/>.

Idaho's educational assessments also provide evidence for the requirements of state and federal accountability systems. Test scores can be employed to evaluate students' learning progress and to help teachers improve their instruction, which in turn has a positive effect on students' learning over time. In particular, the ISAT in Science supports instruction and student learning by measuring growth in student achievement. Assessments can be used as indicators to determine whether students in Idaho are ready with the knowledge and skills that are essential for college education and careers.

The tests are constructed to measure student proficiency in accordance with best practice as described in the *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014). ISAT in Science test scores are useful indicators for understanding individual students' academic achievement of the Idaho content standards and for evaluating whether students' performance is improving over time. Additionally, both individual and aggregated scores can be used for measuring reliability of the test. A discussion of test-score reliability can be found in this volume in Section 3, Reliability. Evidence of measurement and classification precision can be found in Appendices A through C, which includes reliability coefficients, conditional standard error of measurement, and classification accuracy and consistency indices.

---

<sup>1</sup> The term "Idaho State Content Standards in Science" and the term "Idaho State Science Standards" were used interchangeably in this technical report.

The ISAT in Science is a criterion-referenced test that is designed to measure student performance on the Idaho State Science Standards in Idaho schools. As a comparison, norm-referenced tests are designed to rank or compare all students with one another. The ISAT in Science standards and test blueprints are discussed in Volume 2, Test Development, of this technical report. Item development adheres to the principles of universal design in order to ensure that all students have access to the test content. The three-dimensional Idaho State Science Standards are aligned with the Next Generation Science Standards (NGSS) as both sets of standards are based on the same framework<sup>2</sup>. Validity evidence that was from content, construct, and cognitive processes perspectives and that has been collected based on the NGSS was then used to support uses and interpretation of the ISAT in Science test scores. Evidence of content validity can be found in Section 4, Evidence of Content Validity, of this volume. Appendices D through F served as evidence to support the development of science item clusters and Braille forms as well as alignment of science standards.

The scale score and relative strengths and weaknesses at the discipline level are provided for each student to indicate student strengths and weaknesses in different content areas of the test, relative to the other areas and to the district and state. These scores serve as useful feedback that teachers can use to tailor their instruction. To support their practical use across the state, we must examine the reliability coefficients for and the validity of these test scores.

### 3. RELIABILITY

Classical test theory-based reliability indices are not appropriate for science assessments for two reasons. First, in spring 2024, the science test was administered under an adaptive test design. Potentially, each student received a unique set of items, whereas classical test theory-based reliability indices require that the same set of items be administered to a (large) group of students. Second, since item response theory (IRT) methods are used for calibration and scoring, the measurement error of ability estimates is not constant across the ability range, even for the same set of items. The reliability of science tests is computed as follows:

$$\bar{\rho} = [\sigma^2 - \left(\frac{\sum_{i=1}^N CSEM_i^2}{N}\right)]/\sigma^2,$$

where  $N$  is the number of students;  $CSEM_i$  is the conditional standard errors of measurement (CSEM) of the overall ability estimate for student  $i$ ; and  $\sigma^2$  is the variance of the overall ability estimates. The higher the reliability coefficient, the greater the precision of the test.

The marginal reliability of science for the overall sample is reported by grade in Table 2. The overall reliability ranges from 0.88 to 0.89. Due to the new structure of the test, Cambium Assessment, Inc. (CAI) has also explored the relationships between reliability and other important factors, such as the effect of nuisance dimensions (see Section 5 of Volume 1, Annual Technical Report). It was found that if the local dependencies among assertions pertaining to the same item are ignored, the marginal reliability typically increases to 0.90 or above. Ignoring local dependencies can be achieved either by computing the maximum likelihood estimates (MLE) under the unidimensional Rasch model or by setting the variance parameters to zero for all item

<sup>2</sup> See *A Framework for K–12 Science Education* (National Research Council, 2012).

clusters when computing the marginal maximum likelihood estimation (MMLE) under the one-parameter logistic (1PL) bifactor model (see Section 6.1 of Volume 1, Annual Technical Report). By ignoring the local dependencies, which are substantial for many item clusters, the reliability coefficient is overestimating the true reliability of the test. Note, however, that local dependencies are also present to some degree in traditional assessments that make use of item groups (e.g., a set of items relating to the same reading passage). Local dependencies are typically not accounted for by traditional assessments, and hence reported reliability coefficients may be overestimating to some degree the true reliability of these tests. The reliability coefficients are also reported for demographics subgroups in Appendix 4-A, Student Demographics and Reliability Coefficients. It is also worth noting that in an adaptive design, students take items (within the constraints of the content blueprint) that by design maximizes the statistical information from the interaction and thus support smaller CSEMs and higher reliability than fixed form assessments.

*Table 2. Marginal Reliability Coefficients*

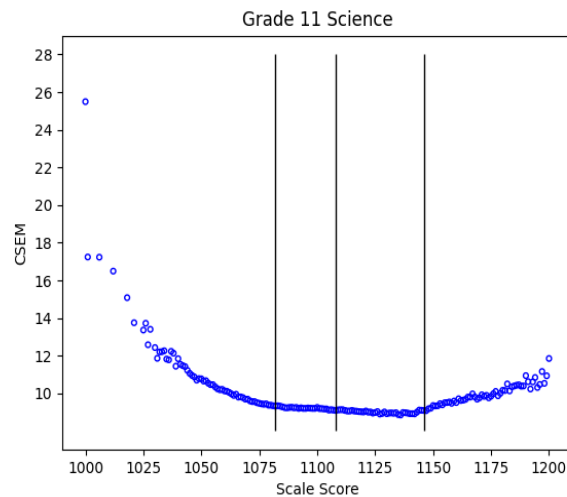

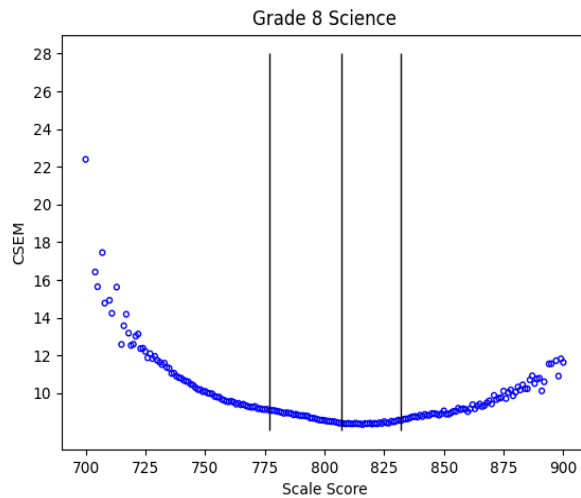

Grade	Sample Size	Reliability
5	23,940	0.90
8	24,101	0.90
11	22,708	0.88

### 3.1 STANDARD ERROR OF MEASUREMENT

The computation method of conditional standard errors of measurement (CSEMs) has been described in Section 6.4 of Volume 1, Annual Technical Report. Figure 1 presents the average CSEM for each scale score. The lowest standard errors are observed near the proficiency cut (the middle vertical line) for all grades, which is a desirable test property. The CSEM at each scale score is reported in Appendix 4-B, Conditional Standard Error of Measurement.

*Figure 1. Conditional Standard Errors of Measurement*

### 3.2 RELIABILITY OF PERFORMANCE CLASSIFICATION

When student performance is reported in terms of performance levels, the reliability of classifying students into a specific level can be computed in terms of the likelihood of accurate and consistent classification, as specified in Standard 2.16 of the *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014).

The reliability of performance classification can be examined in terms of *classification accuracy* (CA) and *classification consistency* (CC). CA refers to the agreement between the classifications based on the form taken and the classifications that would be made based on the students' true scores if hypothetically, they could be obtained. CC refers to the agreement between the classifications based on the form taken and the classifications that would be made based on an alternate, equivalently constructed test form.

In reality, the true ability is unknown, and students are not administered an alternate, equivalent form. Therefore, CA and CC are estimated based on students' item scores, the item parameters, and the assumed latent ability distribution as described in the following sections. The true score is an expected value of the test score with measurement error.

For student  $j$ , the student's estimated ability is  $\hat{\theta}_j$  with an SEM of  $se(\hat{\theta}_j)$ ; and the estimated ability is distributed as  $\hat{\theta}_j \sim N(\theta_j, se^2(\hat{\theta}_j))$ , assuming a normal distribution, where  $\theta_j$  is the unknown true ability of student  $j$ . The probability of the true score at performance level  $l$  ( $l = 1, \dots, L$ ) is estimated as

$$p_{jl} = p(c_{Ll} \leq \theta_j < c_{Ul}) = p\left(\frac{c_{Ll} - \hat{\theta}_j}{se(\hat{\theta}_j)} \leq \frac{\theta_j - \hat{\theta}_j}{se(\hat{\theta}_j)} < \frac{c_{Ul} - \hat{\theta}_j}{se(\hat{\theta}_j)}\right) = p\left(\frac{\hat{\theta}_j - c_{Ul}}{se(\hat{\theta}_j)} < \frac{\hat{\theta}_j - \theta_j}{se(\hat{\theta}_j)} \leq \frac{\hat{\theta}_j - c_{Ll}}{se(\hat{\theta}_j)}\right) = \Phi\left(\frac{\hat{\theta}_j - c_{Ll}}{se(\hat{\theta}_j)}\right) - \Phi\left(\frac{\hat{\theta}_j - c_{Ul}}{se(\hat{\theta}_j)}\right),$$

where  $c_{Ll}$  and  $c_{Ul}$  denote the score corresponding to the lower and upper limits of performance level  $l$ , respectively.

### 3.2.1 Classification Accuracy

Using  $p_{jl}$ , an  $L \times L$  matrix  $E_A$  can be calculated. Each element  $E_{Akl}$  of matrix  $E_A$  represents the expected number of students to score at level  $l$  (based on their true scores) given students from observed level  $k$ , and can be calculated as

$$E_{Akl} = \sum_{p: p_{jl} \in k} p_{jl},$$

where  $p_{jl}$  is the  $j$ th student's observed performance level. The classification accuracy (CA) at level  $l$  is estimated as

$$CA_l = \frac{E_{Akl}}{N_k},$$

where  $N_k$  is the observed number of students scoring in performance level  $k$ .

The CA for the  $p$ th cut is estimated by forming square partitioned blocks of the matrix  $E_A$  and taking the summation over all elements within the block as follows:

$$CAC = (\sum_{k=1}^p \sum_{l=1}^p E_{Akl} + \sum_{k=p+1}^L \sum_{l=p+1}^L E_{Akl}) / N,$$

where  $N$  is the total number of students.

The overall CA is estimated from the diagonal elements of the matrix:

$$CA = \frac{tr(E_A)}{N}.$$

Table 3 provides the CA for the individual cuts. The overall CA of the test ranges from 78.66% to 78.97%. The individual cut accuracy rates are high across all grades and forms, with the minimum value being 90.07% for grade 11. It denotes that more than 90% of the time, we can accurately differentiate students between adjacent performance levels in the spring 2024 ISAT in Science.

The CA for demographic subgroups is presented in Appendix 4-C, Classification Accuracy and Consistency Indices by Subgroups.

*Table 3. Classification Accuracy Index*

Grade	Overall Accuracy (%)	Cut Accuracy (%)		
		Level 2 Cut	Level 3 Cut	Level 4 Cut
5	78.83	93.03	90.79	95.00
8	78.97	93.37	90.29	95.30
11	78.66	90.97	90.07	97.60

### 3.2.2 Classification Consistency

Assuming the test is administered twice independently to the same group of students, similarly to accuracy, an  $L \times L$  matrix  $\mathbf{E}_C$  can be constructed. The element of  $\mathbf{E}_C$  is populated by

$$E_{ckl} = \sum_{j=1}^N p_{jl} p_{jk},$$

where  $p_{jl}$  is the probability of the true score at performance level  $l$  in test 1, and  $p_{jk}$  is the probability of the true score at performance level  $k$  in test 2 for the  $j$ th student. The classification consistency index for the cuts (CCC) and overall classification consistency (CC) were estimated in a way similar to CAC and CA.

$$CCC = (\sum_{k=1}^p \sum_{l=1}^p E_{ckl} + \sum_{k=p+1}^L \sum_{l=p+1}^L E_{ckl}) / N,$$

and

$$CC = \frac{\text{tr}(\mathbf{E}_C)}{N}.$$

Table 4 provides the overall CC and the CC for the cuts. The overall CC of the test ranges from 70.18% to 70.68%. The individual cut consistency rates are high across all grades and forms, with the minimum value being 86.08% for grade 11. In all performance levels, CA is slightly higher than CC. CC rates can be lower than CA; the consistency is based on two tests with measurement errors, but the accuracy is based on one test with a measurement error and the true score. The accuracy and consistency rates for each performance level are higher for the levels with a smaller standard error. The CC for demographic subgroups is presented in Appendix 4-C, Classification Accuracy and Consistency Indices by Subgroups.

*Table 4. Classification Consistency Index*

Grade	Overall Consistency (%)	Cut Consistency (%)		
		Level 2 Cut	Level 3 Cut	Level 4 Cut
5	70.44	90.15	87.10	92.95
8	70.68	90.65	86.45	93.32

Grade	Overall Consistency (%)	Cut Consistency (%)		
		Level 2 Cut	Level 3 Cut	Level 4 Cut
11	70.18	87.23	86.08	96.54

### 3.3 PRECISION AT CUT SCORES

Table 5 presents the mean CSEM at each performance level by grade. The table also includes performance level cut scores and associated CSEM. The CSEM at each scale score is reported in Appendix 4-B, Conditional Standard Error of Measurement.

*Table 5. Performance Levels and Associated Conditional Standard Error of Measurement*

Grade	Performance Level	Mean CSEM	Cut Score (Scale Score)	CSEM at Cut Score
5	1	8.65	-	-
	2	8.20	480	8.28
	3	8.53	506	8.31
	4	9.76	534	8.98
8	1	9.74	-	-
	2	8.73	777	9.09
	3	8.40	807	8.41
	4	8.95	832	8.54
11	1	9.80	-	-
	2	9.22	1,082	9.32
	3	9.02	1,108	9.09
	4	9.66	1,146	9.09

## 4. EVIDENCE OF CONTENT VALIDITY

This section demonstrates that the knowledge and skills assessed by the Idaho Standards Achievement Test (ISAT) in Science are representative of the content standards of the larger knowledge domain. We describe the content standards for the ISAT in Science and discuss the test development process and mapping ISAT in Science tests to the *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014). A complete description of the test development process can be found in Volume 2, Test Development, of this technical report.

## 4.1 CONTENT STANDARDS

The ISAT in Science was based on the Idaho State Science Standards, which have been aligned to the NGSS, adopted by Idaho in 2018. The standards are available for review at the following URL: <https://www.sde.idaho.gov/academic/shared/science/ICS-Science-Legislative.pdf>. Blueprints were developed to ensure that the test and the items were aligned to the standards that they were intended to measure. A complete description of the blueprint and test construction process can be found in Volume 2, Test Development, of this report.

Table 6 presents the disciplines by grade, as well as the number of operational items administered that measured each discipline in the online English version of the ISAT in Science.

*Table 6. Number of Items for Each Discipline*

Grade	Reporting Category	Item Cluster	Stand-Alone Item
5	Earth and Space Sciences	46	55
	Life Sciences	45	54
	Physical Sciences	68	63
8	Earth and Space Sciences	45	51
	Life Sciences	50	72
	Physical Sciences	51	63
11	Earth and Space Sciences	33	37
	Life Sciences	54	63
	Physical Sciences	47	50

## 4.2 INDEPENDENT ALIGNMENT STUDY

While it is critically important to develop and strictly enforce an item development process that works to ensure alignment of test items to content standards, it is also important to independently verify the alignment of test items to content standards. The WebbAlign team of the non-profit Wisconsin Center for Education Products and Services (WCEPS) conducted an alignment study in July 2019. The study comprised two components. The first component addressed the alignment of the Memorandum of Understanding (MOU) item bank, shared by all states that are part of the MOU. In the second component, alignment was investigated for each state participating in the study, in the context of their state-specific blueprint and item bank, which is a particular state-vetted subset of items from the shared MOU item bank (see Volume 2, Test Development, of this technical report).

The results of the alignment study are presented in Appendix 4-F, Alignment Study Executive Summary.

## 5. EVIDENCE OF INTERNAL-EXTERNAL STRUCTURE

In this section, the internal structure of the assessment is explored using the scores provided at the discipline level. The relationship between the discipline scores is just one indicator of the test dimensionality. The Idaho Standards Achievement Test (ISAT) in Science is calibrated with the Rasch testlet model (Wang & Wilson, 2005). The testlet model is a high-dimensional model that incorporates a nuisance dimension for each item cluster (and stand-alone items with four or more assertions) in addition to an overall dimension representing overall proficiency. This approach is innovative and quite different from the traditional approach of ignoring local dependencies. Validity evidence for the internal structure will focus on the presence of cluster effects and how substantial they are. Additionally, confirmatory factor analysis is used to evaluate the fit of the IRT model and to compare the model with alternative models, including those with a simpler internal structure (i.e., unidimensional models without cluster effects) and models with a more elaborate internal structure (refer to Section 5.4, Confirmatory Factor Analysis).

Another pathway is to explore observed correlations between the discipline scores. However, as each discipline is measured with a small number of items, the standard errors of the observed scores within each discipline are typically larger than the standard error of the total test score. Disattenuating for measurement error could offer some insight into the theoretical true score correlations. Both observed correlations and disattenuated correlations are provided in the following section.

### 5.1 CORRELATIONS AMONG DISCIPLINE SCORES

Table 7 presents the observed and disattenuated correlation matrix of the discipline scores. The observed correlations range from 0.66 to 0.74, and disattenuated correlations range from 0.95 to 0.99.

In some instances, the observed correlations were lower than one might expect. However, as previously noted, the correlations were subject to a large amount of measurement error at the discipline level due to the limited number of items from which the scores were derived. Consequently, interpretation of these correlations, as either high or low, should be made cautiously. After correcting for measurement error, the correlations between the discipline scores become very high. The disattenuated correlations are close to 1, supporting the use of a psychometric model that does not include a separate dimension for each of the three disciplines.

*Table 7. Correlations Among Disciplines*

Grade	Reporting Category	Earth and Space Sciences (ESS)	Life Sciences (LS)	Physical Sciences (PS)
5	ESS	0.77*	0.95	0.96
	LS	0.73	0.76*	0.95
	PS	0.72	0.70	0.73*
8	ESS	0.75*	0.97	0.96
	LS	0.74	0.77*	0.97
	PS	0.73	0.74	0.76*

Grade	Reporting Category	Earth and Space Sciences (ESS)	Life Sciences (LS)	Physical Sciences (PS)
11	ESS	0.66*	0.99	0.96
	LS	0.69	0.73*	0.97
	PS	0.66	0.70	0.71*

\*Diagonal value represents marginal reliability for each discipline. Observed correlations are below the diagonal, and disattenuated correlations are above.

## 5.2 CONVERGENT AND DISCRIMINANT VALIDITY

Collectively, Standard 1.16 through Standard 1.19 of the *Standards for Educational and Psychological Testing* (AERA, APA, & NCME, 2014) emphasize practices to provide evidence of convergent and discriminant validity. It is a part of validity evidence demonstrating that assessment scores are related as expected with criteria and other variables for all student groups. However, a second, independent test measuring the same science construct as the ISAT in Science, which could easily permit for a cross-test set of correlations, was not available. Alternatively, the correlations between subscores were examined. The *a priori* expectation is that subscores within the same subject (e.g., correlation of science disciplines within science) will correlate more positively than subscores across subjects (e.g., correlation of science disciplines with reporting categories within mathematics). These correlations are based on a small number of items; consequently, the observed score correlations will be smaller in magnitude as a result of the larger measurement error at the subscore level. For this reason, both the observed score and the disattenuated correlations are provided.

Observed and disattenuated subscore correlations were calculated both within and across subjects. The pattern was generally consistent with the *a priori* expectation that subscores within a test correlate higher than correlations between tests measuring a different construct. The correlations between reporting categories from science, English language arts (ELA), and mathematics are presented in Table 8, Table 9, and Table 10. On the diagonal, the reliability coefficient of the reporting category is shown.

Table 8. Correlations Across Subjects, Grade 5

Subject	Number of Students	Reporting Category	Science			English Language Arts (ELA)				Mathematics

\*Diagonal value represents the reliability coefficient of the reporting category. Observed correlations are below the diagonal, and disattenuated correlations are above. Disattenuated correlations larger than 1 were truncated to 1.

Additionally, the correlation was computed among the overall scores for the three tested subjects: ELA, mathematics, and science. Correlations are presented in Table 11 and are relatively high, between 0.70 and 0.79.

*Table 11. Correlations Across Spring 2024 ELA, Mathematics, and Science Scores*

Grade	N	English Language Arts (ELA) & Mathematics	ELA & Science	Mathematics & Science
5	23,639	0.77	0.79	0.79
8	23,683	0.76	0.76	0.78
11	21,849	0.70	0.72	0.74

### 5.3 CLUSTER EFFECTS

The ISAT in Science is calibrated with the Rasch testlet model (Wang & Wilson, 2005). The testlet model is a high-dimensional model that incorporates a nuisance dimension for each item cluster in addition to an overall dimension representing overall proficiency. Section 5.1 of Volume 1, Annual Technical Report, presents a detailed description of the IRT model. The internal (latent) structure of the model is presented in Section 5.4 of this volume. The psychometric approach for the assessment is innovative and quite different from the traditional approach of ignoring local dependencies. The validity evidence for the internal structure presented in this section relates to the presence of cluster effects (i.e., nuisance dimensions) and how substantial they are.

Simulation studies conducted by Rijmen, Jiang, and Turhan (2018) confirmed that both the item difficulty parameters and the cluster variances are recovered well for the Rasch testlet model under a variety of conditions. Cluster effects with a range of magnitudes were recovered well. The results obtained by Rijmen et al. (2018) confirmed earlier findings reported in the literature (e.g., Bradlow, Wainer, & Wang, 1999) under conditions that were chosen to closely resemble the assessment. For example, in one of the studies, the item location parameters and cluster variances used to simulate data were based on the results of a pilot study.

We examined the distribution of cluster variances obtained from the 2022 IRT calibrations for the entire bank used across all states that participate in the Memorandum of Understanding (MOU) item-sharing agreement and the states that rely on the science Independent College and Career Readiness (ICCR) item pool.

For elementary school, the estimated value of the cluster variances of all operational, scored items ranged from 0 to 5.13, with a median value of 0.50 and a mean value of 0.79. As a comparison, the estimated variance parameter of the overall dimension for Idaho elementary school in 2022 was  $\hat{\sigma}_{\theta_{ID}}^2 = 0.99$ .

For middle school, the estimated value of the cluster variances of all operational, scored items ranged from 0 to 3.93, with a median value of 0.52 and a mean value of 0.70. The estimated variance parameter of the overall dimension for Idaho middle school in 2022 was  $\hat{\sigma}_{\theta_{ID}}^2 = 0.79$ .

For high school, the estimated value of the cluster variances of all operational, scored items ranged from 0.07 to 7.75, with a median value of 0.46 and a mean value of 0.80. The estimated variance parameter of the overall dimension for Idaho high school in 2022 was  $\hat{\sigma}_{\theta_{ID}}^2 = 0.70$ .

Figure 2 through Figure 4 present the histograms of the cluster variances expressed as the proportion of the systematic variance due to the cluster variance for each cluster (computed as  $\eta_g = \frac{\hat{\sigma}_g^2}{\hat{\sigma}_{\theta_{ID}}^2 + \hat{\sigma}_g^2}$ ), where  $\hat{\sigma}_{\theta_{ID}}^2$  is the variance estimate of the overall proficiency of Idaho students. The variance proportion shows the relative magnitude of the variance of a cluster compared to the variance of the overall dimension. For instance, if the variance proportion of a cluster is larger than 0.5, then the cluster variance is larger than the overall variance; otherwise, the cluster variance is smaller than the overall variance. For all three grade bands, a wide range of cluster variances is observed. These results indicate that, for all grades, cluster effects can be substantial and provide evidence for the appropriateness of a psychometric model that explicitly takes into account local dependencies among the assertions of an item cluster.

*Figure 2. Cluster Variance Proportion for Operational Items in Elementary School*

*Figure 3. Cluster Variance Proportion for Operational Items in Middle School**Figure 4. Cluster Variance Proportion for Operational Items in High School*

## 5.4 CONFIRMATORY FACTOR ANALYSIS

In Section 5.4, Cluster Effects, of this volume, evidence is presented for the existence of substantial cluster effects. In this section, the internal structure of the IRT model used for calibrating the item parameters is further evaluated using confirmatory factor analysis. In addition, alternative models are considered, including models with a simpler internal structure (e.g., unidimensional models) and models with a more elaborate internal structure.

Estimation methods for confirmatory factor analysis for discrete observed variables are not well suited for incomplete data collection designs where each case has data only on a subset of the set of observed variables. The linear-on-the-fly (LOFT) test design results in sparse data matrices. Every student is responding only to a small number of items relative to the size of the item pool, so data are missing on most of the manifest variables for any given student. In 2018 and 2019, a LOFT test design was used for all operational science assessments inspired by the NGSS framework, except for Utah. As a result, the student responses of these other states are not readily amenable for the application of confirmatory factor analysis techniques.

The 2018 Utah operational field test for science made use of a set of fixed-form tests for each grade. Therefore, the data for each fixed-form test are complete, and the fixed-form tests are amenable to confirmatory factor analysis. The Utah science standards, even though grade-specific for middle school, were developed under a framework similar to the one developed for the NGSS, and a crosswalk is available between both sets of standards. Utah is part of the MOU, and many of the other states that take part in the MOU also use the middle school items developed for and owned by Utah. Taken together, analyzing the fixed science forms that were administered in Utah in 2018 can provide evidence with respect to the internal structure of the ISAT in Science.

In 2018, Utah’s science assessments comprised a set of fixed-form tests per grade, and all items in these forms were clusters. The number of fixed-form tests varied by grade, but within each grade, the total number of clusters was the same across forms. However, some items were rejected during the rubric validation or data review and were removed from this analysis. All students with a “completed” status were included in the factor analysis. The percentage of students per grade that had a status other than “completed” was less than 0.85%. Table 12 summarizes the number of forms included in this analysis, the number of clusters per discipline (range across forms), the number of assertions (range across forms), and the number of students (range across forms) for each of the grades.

**Table 12. Numbers of Forms, Clusters Per Discipline (Range Across Forms), Assertions Per Form (Range Across Forms), and Students Per Form (Range Across Forms)**

Grade	Number of Fixed Forms	Number of Clusters Per Discipline in Each Form			Number of Assertions Per Form	Number of Students Per Form
		<i>Physical Sciences</i>	<i>Earth and Space Sciences</i>	<i>Life Sciences</i>		
<b>6</b>	3	2	2–3	2–3	74–83	6,804–6,881
<b>7</b>	6	2	2	5	83–89	3,822–3,890
<b>8</b>	3	6–7	2	2	93–100	5,061–5,104

The factor structure of a testlet model, which is the model used for calibration, is formally equivalent to a second-order model. Specifically, the testlet model is the model obtained after a Schmid–Leiman transformation of the second-order model (Li, Bolt, & Fu, 2006; Rijmen, 2009; Yung, Thissen, & McLeod, 1999). In the corresponding second-order model, the group of assertions related to a cluster are indicators of the cluster, and each cluster is an indicator of overall science performance. Because assertions are not pure indicators of a specific factor, each assertion

has a corresponding error component. Similarly, clusters include an error component indicating they are not pure indicators of the overall science performance.

CAI used confirmatory factor analysis to evaluate the fit of the second-order model described earlier to student data from spring 2018. Three additional structural models were included in the analysis, as well. In the first model, only one factor represented overall science performance. All assertions are indicators of this overall proficiency factor. The first model was a testlet model where all cluster variances were zero. In the second model, assertions were indicators of the corresponding science discipline, and each discipline was an indicator of the overall science performance. This was a second-order model with science disciplines rather than clusters as first-order factors. This model did not take the cluster effects into account. In the last, most general model, assertions were indicators of the corresponding cluster, and clusters were indicators of the corresponding science discipline, with disciplines being indicators of the overall science performance.

For the sake of simplicity, the models in the analysis are here referred to as the following:

- Model 1–Assertions-Overall Science (one factor model)
- Model 2–Assertions-Disciplines-Overall Science (second-order model)
- Model 3–Assertions-Clusters-Overall Science (second-order model)
- Model 4–Assertions-Clusters-Disciplines-Overall Science (third-order model)

Figure 5 through Figure 8 illustrate these four structural models. Model 1 is nested within Models 2, 3, and 4. Also, Models 2 and 3 are nested within Model 4. The paths from the factors to the assertions represent the first-order factor loadings. Note that all four models include factor loadings for the assertions, which differs from the calibration model, where all the discrimination parameters of the assertions were set to 1. All models were estimated using the lavaan package in R (Rosseel, 2012), with the diagonally weighted least squares (DWLS) method for parameter estimation, the recommended approach for binary data (Flora & Curran, 2004).

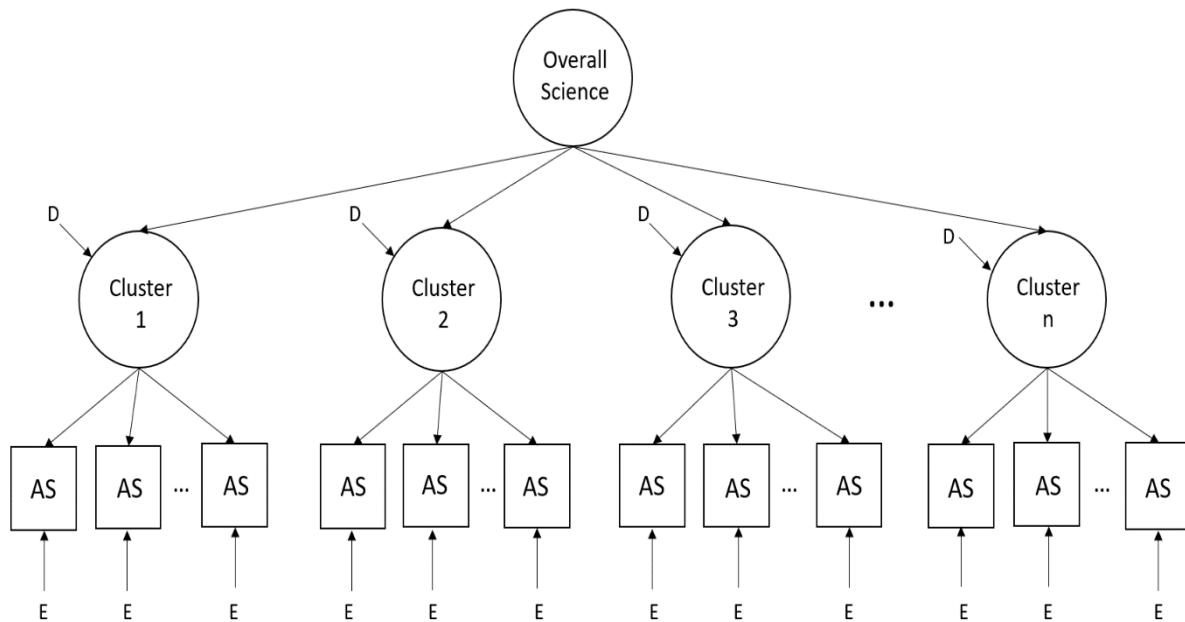

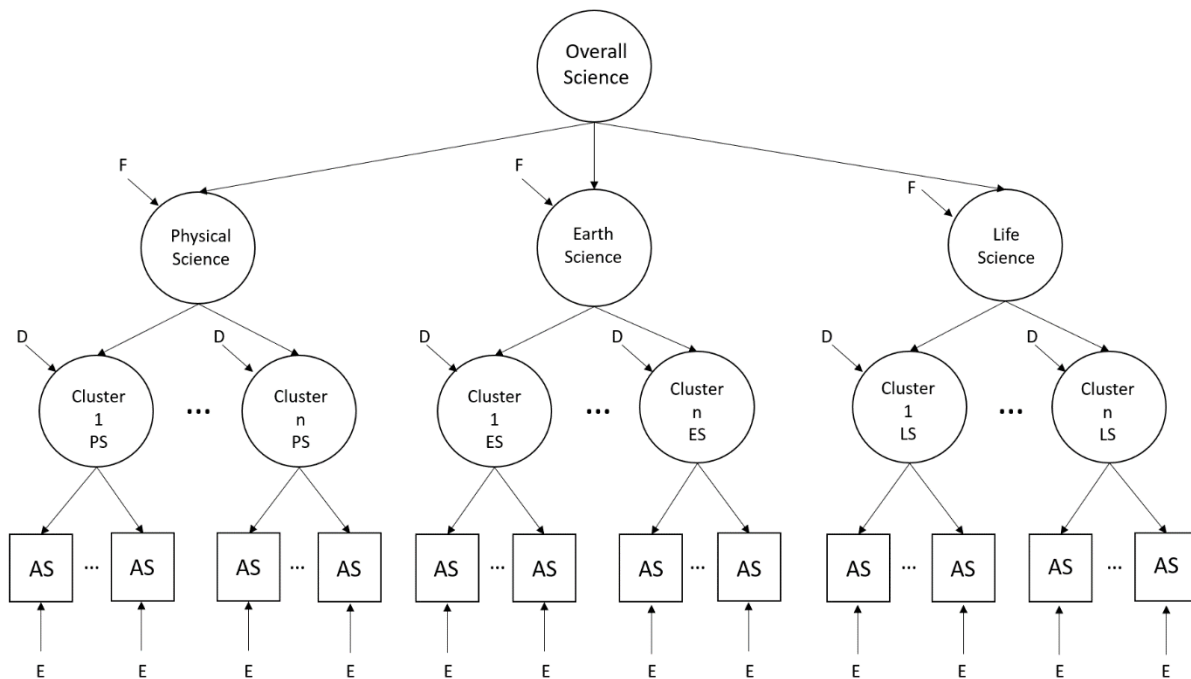

Figure 8. Third-Order Structural Model (Assertions-Clusters-Disciplines-Overall): “Model 4”

### 5.4.1 Results

For each test form, fit measures were computed for each of the four models. The fit measures used to evaluate goodness-of-fit were the comparative fit index (CFI), the Tucker-Lewis index (TLI), the root mean square error of approximation (RMSEA), and the standardized root mean residual (SRMR). CFI and TLI are relative fit indices, meaning they evaluate model fit by comparing the model of interest to a baseline model. RMSEA and SRMR are indices of absolute fit. Table 13 provides a list of these measures along with the corresponding thresholds indicating a good fit.

*Table 13. Guidelines for Evaluating Goodness of Fit*

Goodness-of-Fit Measure*	Indication of Good Fit
CFI	$\geq 0.95$
TLI	$\geq 0.95$
RMSEA	$\leq 0.06$
SRMR	$\leq 0.08$

\*Brown, 2015; Hu & Bentler, 1999

Table 14 through Table 16 show the goodness-of-fit statistics for grades 6 through 8, respectively.<sup>3</sup> Numbers in bold indicate those indices that did not meet the criteria established in Table 13. Across all grades and models, the following conclusions can be drawn:

- Model 1 shows the most misfit across grades and forms.
- Across forms, Model 3 generally shows more improvement in model fit relative to Model 1 than Model 2 (i.e., higher values for CFI and TLI and lower values for RMSEA and SRMR). This means that accounting for the clusters resulted in a higher improvement in model fit over a single factor model than accounting for disciplines.
- Model 4 does not show improvement in model fit over Model 3. Fit measures remained the same (or had a difference of 0.001 or smaller in very few cases) across forms for Models 3 and 4. Hence, including the disciplines in the model (when clusters were taken into account) did not improve model fit.
- Overall model fit for Models 3 and 4 decreases with decreasing grades. For grade 8, all fit indices for Models 3 and 4 indicate good model fit for all three forms. For grade 7, all fit indices for Models 3 and 4 indicate good fit for two out of the six forms, and the degree of misfit for the other four forms is small. For grade 6, all three forms have fit indices above the threshold values for at least one of the absolute fit indices for Models 3 and 4. The amount of misfit is small for the RMSEA but more substantial for the SRMR for two out of the three forms.

<sup>3</sup> For very few assertions per form and model, some error variances were slightly below 0. For grade 6, 1–2 assertions per form and model had error variance below 0, with the lowest error variance being -0.027. For grade 7, Forms 1, 2, 5, and 6 had one negative error variance for one assertion in Models 3 and 4, with the lowest error variance being -0.099. Form 4 had 1–2 assertions with negative error variance in each model, and the lowest error variance was -0.102. For grade 8, there were no assertions with negative error variances for any of the forms and models.

	<b>3</b>	0.970	0.969	0.038	0.064

Note. Numbers in bold do not meet the criteria for goodness of fit.

For Models 3 and 4, grade 6 showed some degree of misfit across all three forms according to the measures of absolute model fit, especially for the SRMR. Further examination indicated that the lack of fit could be attributed to a single item that was common to all three grade 6 forms that were part of this factor analysis study. After removing this item, there were only two forms that had two or more clusters per discipline. The fit for both forms improved drastically in Models 3 and 4, with all fit measures except the SRMR for one form meeting the criteria for model fit. The SRMR value that exceeded the threshold value did so barely, with a value of 0.083. Table 17 shows the fit measures for grade 6 after removal of the item causing misfit. Note that, unlike Models 3 and 4, Models 1 and 2 still did not meet the criteria of model fit after removing the item.

Table 17. Fit Measures Per Model and Form, Grade 6, with One Cluster Removed<sup>4</sup>

Model	Form	CFI	TLI	RMSEA	SRMR
<b>Model 1</b> Assertions-Overall (one-factor model)	<b>1</b>	0.977	0.976	<b>0.094</b>	<b>0.130</b>
	<b>2</b>	0.974	0.973	<b>0.082</b>	<b>0.118</b>
<b>Model 2</b> Assertions-Disciplines-Overall (second-order model)	<b>1</b>	0.986	0.986	<b>0.072</b>	<b>0.106</b>
	<b>2</b>	0.985	0.984	<b>0.062</b>	<b>0.094</b>

	<b>2</b>	0.991	0.991	0.048	0.072
<b>Model 4</b> Assertions-Clusters-Disciplines-Overall (third-order model)	<b>1</b>	0.992	0.991	0.057	<b>0.083</b>
	<b>2</b>	0.991	0.991	0.048	0.072

Note. Numbers in bold do not meet the criteria for goodness of fit.

Table 18 shows the estimated correlations among disciplines for Model 4 (third-order model). The correlations are all very high, ranging between 0.913 and 1. The high correlations between the disciplines in Model 4 indicate that, after taking into account the cluster effects, the disciplines do not add much to the model. This may explain why Model 4 did not show an improvement in fit compared to Model 3. Overall, the findings support the IRT model used for calibration.

Table 18. Model-Implied Correlations Per Form for the Disciplines in Model 4

Grade	Form	Discipline	Earth and Space Sciences	Life Sciences
6	1	Physical Sciences	0.999	0.941
		Earth and Space Sciences	–	0.940
	2	Physical Sciences	1.000	0.964
		Earth and Space Sciences	–	0.964
	3	Physical Sciences	0.975	0.923
		Earth and Space Sciences	–	0.947
7	1	Physical Sciences	0.983	0.947
		Earth and Space Sciences	–	0.937
	2	Physical Sciences	0.978	0.972
		Earth and Space Sciences	–	0.951
	3	Physical Sciences	0.955	0.936
		Earth and Space Sciences	–	0.966
	4	Physical Sciences	0.938	0.913

<sup>4</sup> One assertion per model in form 1 and one assertion on three of the models in form 2 had error variances below 0, with the lowest error variance being -0.027.

Grade	Form	Discipline	Earth and Space Sciences	Life Sciences
	<b>5</b>	Earth and Space Sciences	–	0.973

		Earth and Space Sciences	–	0.935
	<b>3</b>	Physical Sciences	0.966	0.978
		Earth and Space Sciences	–	0.988

### 5.4.2 Conclusion

The models with no cluster effects provided the highest degrees of misfit across forms and grades (Models 1 and 2), indicating that the cluster effects need to be taken into account as additional latent variables. On the other hand, once the cluster effects are accounted for, a single science dimension is sufficient (Model 3): Including additional dimensions for the science disciplines (Life Science, Physical Science, Earth and Space Sciences) did not improve model fit, and the correlations among those three dimensions are very high (Model 4). Model 3, with a single overall dimension for science and additional latent variables to account for the effect of item clusters, provided the best balance between model fit and parsimony.

Overall, the findings support the use of the Rasch testlet model as the IRT calibration model and the reporting of an overall score directly computed from all the items a student took. Because there are enough items within each discipline in the test blueprint, discipline subscores can be reported at the individual level although they may not provide much unique information from the total score for most students. However, many stakeholders often desire information about student performance in addition to a single overall score. Note that it is not uncommon to provide subscores at the individual level even when the assessment is essentially unidimensional in a psychometric sense. For example, based on the dimensionality analyses for the Smarter Balanced Assessment, there is evidence suggesting “no consistent and pervasive multidimensionality was demonstrated” (Smarter Balanced Assessment Consortium, 2016, p.182), yet individual claim scores are routinely reported in addition to overall ELA and mathematics scores.

## **6. FAIRNESS IN CONTENT**

The principles of universal design of assessments provide guidelines for test design to minimize the impact of construct-irrelevant factors in assessing student achievement. Universal design removes barriers to provide access for the widest range of students possible. Seven principles of universal design are applied in the process of test development (Thompson, Johnstone, & Thurlow, 2002):

1. Inclusive assessment population
2. Precisely defined constructs
3. Accessible, non-biased items
4. Amenability to accommodations
5. Simple, clear, and intuitive instructions and procedures
6. Maximum readability and comprehensibility
7. Maximum legibility

Test development specialists have received extensive training on the principles of universal design and apply them in the development of all test materials. In the review process, adherence to the principles of universal design is verified by Idaho educators and stakeholders. More details on how to reduce construct-irrelevant variance through universal design and on training on the principles of universal design can be found in Section 2, Item Development Process that Supports Validity of Claims as well as Appendix 2-C, Style Guide for Science Items of Volume 2.

### **6.1 COGNITIVE LABORATORY STUDIES**

In 2017, when the development of item clusters for the states that are part of the Memorandum of Understanding (MOU) began, cognitive lab studies were carried out to evaluate and refine the process of developing item clusters aligned to the NGSS. Results of the cognitive lab studies confirmed the feasibility of the approach. Item clusters were completed within 12 minutes on average, and students reported being familiar with the format conventions and online tools used in the item clusters. They appeared to easily navigate the item clusters' interactive features and response formats. In general, students who received credit on a given item displayed a reasoning process that aligned with the skills that the item was intended to measure.

A second set of cognitive lab studies were carried out in 2018 and 2019 to determine if students using braille can understand the task demands of selected accommodated, three-dimensional science standards-aligned item clusters and can navigate the interactive features of these clusters in a manner that allows them to fully display their knowledge and skills relative to the constructs of interest. In general, both the students who relied entirely on braille and/or the Job Access with Speech (JAWS) screen-reading software and those who had some vision and were able to read the screen with magnification were able to find the information they needed to respond to the questions, navigate the various response formats, and finish within a reasonable amount of time. The clusters were clearly different from (and more complex than) other tests with which the students were familiar, however; and the study recommended that students be given adequate time to practice

with at least one sample cluster before taking the summative test. The study also resulted in tool-specific recommendations for accessibility for visually impaired students. The reports of both sets of cognitive lab studies are presented in Appendix 4-D, Science Clusters Cognitive Lab Report, and Appendix 4-E, Braille Cognitive Lab Report.

## **6.2 STATISTICAL FAIRNESS IN ITEM STATISTICS**

Differential item functioning (DIF) analyses were conducted with other states that field-tested the items for the initial item bank. A thorough content review was performed in those states. The details surrounding this review of items for bias is further described in Section 4.4 of Volume 1, Annual Technical Report, along with the DIF analysis process for the ISAT in Science.

## **7. SUMMARY**

This volume is intended to provide a collection of reliability and validity evidence to support appropriate inferences from the observed test scores. The overall results can be summarized as follows:

- **Reliability.** Various measures of reliability are provided at the aggregate and subgroup levels, showing that the reliability of all tests is in line with acceptable industry standards.
- **Content Validity.** Evidence is provided to support the assertion that content coverage on each test was consistent with the test specifications of the blueprint across testing modes.
- **Internal Structural Validity.** Evidence is provided to support the selection of the measurement model, the tenability of model assumptions, and the reporting of an overall score and subscores at the reporting category levels.
- **Relationship of Test Scores to External Variables.** Evidence of convergent and discriminant validity is provided to support the relationship between the test and other measures intended to assess similar constructs, as well as between the test and other measures intended to assess different constructs.
- **Test Fairness.** Items are developed following the principles of universal design, which removes barriers to provide access for the widest range of students possible. Evidence of test fairness is provided statistically using DIF analysis in tandem with content reviews by specialists.

## 1. INTRODUCTION

American Institutes for Research (AIR) and a group of states are developing methods to measure student learning of Next Generation Science Standards (NGSS) and other standards derived from the K–12 science framework. Educators involved in the development of the framework and the standards encourage measuring learning using integrated tasks that require a student’s sustained concentration on a realistic science or engineering task. This set of cognitive interviews was undertaken early in the development process to test and refine our approach to developing item clusters to measure NGSS and related performance expectations (PEs).

The approach taken for each cluster was to identify a *phenomenon* to be explained, modeled, described, or analyzed (as appropriate for the performance expectation) and have a sequence of interrelated, often interdependent items (some containing multiple interactions) that build to support the completion of a task.

This set of cognitive interviews was designed to provide data on newly developed item clusters aligned with the NGSS. We evaluated 12 clusters, four designed for elementary school, four designed for middle school, and four designed for high school. Each cluster contained one to five items, many with separately scored sub-items. Per the request of the item development team, the labs focused on the following questions:

- How long did students take to respond to each cluster?
- How well did students score on each item and on each cluster overall?
- What aspects of the items were confusing to students?
- What reasoning skills did students display as they worked their way through each item?

A limitation of the cognitive lab analysis was that many of the students had limited exposure to content covered in the clusters, particularly the clusters on German Pyramid Candle (elementary school), Morning Fog (middle school), Texas Weather (middle school), Saving the Tuna (high school), and Tomcods (high school). To partially offset this lack of formal instruction, students were provided with a one- or two-page hard-copy lesson on the relevant science content for each cluster. Some of the later cognitive interviews were conducted in schools in which the teachers had received substantial training in teaching the new standards.

The remainder of this report includes an overview of methods, a description of the study sample, a discussion of the findings for each of the 12 clusters, and a final section on the students’ overall perceptions of the science clusters.

## **2. METHODS**

### **2.1 STUDY DESIGN**

Between January and May 2017, cognitive interviews were conducted with 18 elementary school students, 12 middle school students, and 15 high school students. The interviews lasted one and one-half hours, and each student was presented with all four clusters for their grade level. The order of the clusters was rotated so that the risk of student fatigue or missing responses was distributed across the clusters.

Students were encouraged to think out loud while they were responding to the items (concurrent think-aloud), and interviewers were instructed to use follow-up probes to clarify and expand on what each student said (or what each student was observed to do). To preclude the possibility that students' responses to later items would be influenced by probing on earlier items, probes were only administered after students had completed all the items in a cluster.

At the start of the interview, the interviewer trained the student on the concurrent think-aloud technique. The interviewer first modeled the technique and then had the student practice on one or, if necessary, two items. Lower grade multiple-choice mathematics items were used for the modeling and practice.

After the think-aloud training, students were provided with a hard-copy lesson on the relevant science content, as described previously. The item development team developed the lessons, and the interviewer collected the hard copy before the student started the cluster.

At the end of the cognitive interview, each student was asked three general questions: (1) whether the student had studied any of the cluster topics in school, (2) whether the student had taken tests that look similar and/or used similar tools, and (3) how hard the student thought this test was.

### **2.2 TRAINING AND PILOT TESTING**

Five interviewers (and one backup interviewer) were trained for the project. Since all the interviewers were experienced in the cognitive interview technique, the training primarily focused on reviewing the content of the clusters and familiarizing the interviewers with the test platform and the specifics of the interview protocols. Project leads provided a separate two-hour training for the protocol at each grade level.

Additionally, at each grade level, an experienced team member conducted a pilot interview to fine tune the protocol and, especially, to determine the number of clusters that could be covered in one interview and hence the number of students that would be required to adequately test the clusters. The pilot administrations confirmed that, at each grade level, all four clusters could be covered in a single one and one-half hour interview. Thus, for each cluster, we ultimately had data on 12 to 18 students.

### **2.3 STUDY SAMPLE**

Students were primarily drawn from the San Francisco Bay area. Utah also contributed students for the elementary school sample, and Connecticut contributed students for the high school sample.

The Utah students were particularly valuable to the study because they were in schools where teachers were receiving Next Generation Science Standards (NGSS) training from an NGSS author.

To recruit students in the San Francisco Bay area, the project manager and a designated scheduler at the American Institutes for Research (AIR) worked with a recruitment firm. This firm used a household-based approach to recruitment and employed an AIR-developed recruitment screener. Having recognized that exposure to inquiry-based science would be limited, we targeted higher achieving students with the expectation that they would be the most likely to have received this instruction and have benefited from it. We tried to recruit students whose parents reported the students' grades as being mostly As and/or Bs in science. We balanced the sample on gender and ethnicity (white/non-white).

In Utah and Connecticut, the AIR program manager worked directly with designated school districts to recruit students near Salt Lake City and Hartford, respectively. The cognitive interviews were conducted at the AIR offices in San Mateo, California, and on-site at the schools in Utah and Connecticut. The characteristics of the sample are summarized in Table 1 and shown by student in the Appendix.

*Table 1. Characteristics of Sample, by Grade Level*

Characteristic	Elementary School ( <i>n</i> = 18)	Middle School ( <i>n</i> = 12)	High School ( <i>n</i> = 15)

### 3. FINDINGS

We begin this section with a summary of findings that includes key take-aways from the cognitive interviews and basic performance statistics for each of the 12 clusters.

The summary is followed by a detailed discussion of cognitive interview findings for each of the 12 clusters. Each cluster-level discussion starts with a summary of student performance, a list of task demands, and an image of the cluster stimulus. These are followed by an item-by-item discussion that, for each item, displays the item text, summarizes score patterns, and addresses students' comprehension and reasoning.

The discussion of findings ends with a summary of students' general perceptions of the science clusters, as expressed at the end of the cognitive interviews.

#### 3.1 SUMMARY OF FINDINGS

##### 3.1.1 Key Take-Aways

###### *Feasibility of Cluster Approach*

Results from the cognitive interviews suggest that it is feasible to incorporate item clusters into standardized science tests. On average, the clusters took 12 minutes to complete, and students reported being familiar with the format conventions and tools used in the clusters and appeared to easily navigate the clusters' interactive features and response formats.

- When questioned at the end of the cognitive interviews, nearly all students at each grade level reported that they had taken online tests that used similar page layouts, multimedia, and tools (e.g., page layouts with stimulus on the left and items on the right; embedded video; scroll bars; Back, Next, and Zoom in/Zoom out buttons; drop-down menus; and connect line and Add Arrow tools).
- Further, interviewers noted that students at all grade levels appeared comfortable navigating the clusters and, generally speaking, understood how to interact with the simulations and the response formats. When students experienced confusion, it was due to idiosyncratic problems with specific simulations or test items.

###### *Relationship to Content Knowledge*

Across grade levels, most students who participated in the cognitive interviews found the greatest challenge to be their lack of relevant content knowledge or experience applying science and engineering practices. This is not unexpected given that the clusters were built to measure NGSS constructs, and most of the students in the sample had not been exposed to NGSS-based instruction.

- Utah students, who were specifically included in the elementary school sample because they came from schools in which teachers were receiving NGSS training from an NGSS author, did better on all clusters. Details are given in the next subsection, where we summarize student performance by cluster.

Many students commented on their lack of relevant content knowledge during the think-alouds, and, when questioned at the end of the interview, students reported that they lacked prior

instruction in most of the topics covered by the clusters. If they had studied those topics, they said that it was at less depth than required to be successful. For example, one high school student said, in reference to the Blood Sugar Regulation cluster, that she had reviewed molecule concentrations but never discussed how they are impacted by meals, “not that in-depth, more gone over these and what they do for the body.”

- By contrast, one of the Utah students said he had studied all four elementary school topics. “At the beginning of the year we studied the heat one and how we can help make a motor turn something on, like a light bulb. I thought of that. Maybe it was just backwards, the light was helping the fan to spin. The light was turning or making it spin by the energy it was producing. I remember last year, in 4th grade, we studied the Grand Canyon and the animals, and we did a little bit this year, and the animals that were living in the walls like trilobite and some others like starfish. We saw this video of this hole that was in Arizona, and there were tons of fossils in it. I think we studied a little bit on the terrarium one . . . We studied a little bit about [the desert plants]. About how each plant could survive.”

### ***Measuring Intended Constructs***

In general, students who received credit on a given item (and some who did not) displayed a reasoning process that aligned with the skills that the item was intended to measure.

- This held true even for standard multiple-choice or multi-select items. For example, thinking aloud as he responded to this question in the Redwall Limestone cluster,

#### **Part A**

Within the Grand Canyon, a rock layer contains fossils of octopi (plural of “octopus”), brachiopods, and corals. What can you conclude about the environment of the Grand Canyon region from the fossil evidence?

- Ⓐ The Grand Canyon region was always desert.
- Ⓑ The Grand Canyon region was once underwater.
- Ⓒ The Grand Canyon region experienced a lot of rain.
- Ⓓ The fossils do not provide any information about the environment.

one elementary school student first read option A, *[t]he Grand Canyon region was always desert*, out loud. Then he said he wanted to check the next option and read *[t]he Grand Canyon region was once underwater*. The student said that option B could be the answer, “but the first option [A] is not because it said in the question [the fossils] were sea animals.” The student then read option C, *[t]he Grand Canyon region experienced a lot of rain*, and option D, *[t]he fossils do not provide any information about the environment*. He said that the answer couldn’t be option D because “[the question] doesn’t have anything to do with the animals that are living today.” He said it probably wasn’t option C because “even if it rained, [but] it wasn’t an ocean, then the coral couldn’t live there.” The student concluded that the correct answer had to be B.

- In another example, an elementary school student explained her response to Part B of this two-part item from the Desert Plants cluster

The following question has two parts. First, answer part A. Then, answer part B.

Use the data from the experiment to compare the survival of the three types of plants in the desert.

### Part A

Record the data from the experiment by adding numbers to the table.

	Mesquite Trees	Cactus Plants	Bird's Nest Ferns
Number of plants at start of experiment			
Number of plants at end of experiment			

### Part B

Select the **two** statements that are supported by the data in the table you created.

- ☐ All types of plants can survive in all environments.
- ☐ No types of plants can survive in a dry desert environment.
- ☐ All types of plants can survive in the dry desert environment.
- ☐ Some types of plants cannot survive in the dry desert environment.
- ☐ Some types of plants survive better than others in the dry desert environment.

by saying that she chose the second-to-last option (*[s]ome types of plants cannot survive in the dry desert environment*) because “at the start of the experiment, there was a total of 5 bird’s nest ferns, and then they all died, and also because one of the mesquite trees – they died – but I mean, most of them still remained.” And she chose the last option (*[s]ome types of plants survive better than others in the dry desert environment*) because “out of all 3 of the plants, the cactus all lived instead of dying.” She shared that she did not choose the first option (*[a]ll types of plants can survive in all environments*) because “As you can see, some of them died – like the bird’s nest ferns and the mesquite trees.” She shared that she did not choose the second option (*[n]o types of plants can survive in a dry desert environment*) “because the cactus – they still lived.” She shared that she did not choose the third option (*[a]ll types of plants can survive in the dry desert environment*) “because the bird’s nest ferns died.”

There were exceptions where students gained or lost credit for non-construct relevant reasons, but these were related to specific item flaws that could be fixed before the items were used operationally.

### General Recommendations for Improvements

While the validity of the general approach was supported by the cognitive lab findings, there were flaws in specific types of items that can and should be remediated before using the items operationally:

- Students needed more cueing on multi-select items such as the following:

**Part B**

From the list of additional experiments, select the evidence that would support your answer in part A.

- ☐ Scientists grow a sample of wild-type *Mycobacterium tuberculosis* in the lab. Over time, some of the bacteria show resistance to rifampin.
- ☐ Scientists plate a colony of wild-type *Mycobacterium tuberculosis* and a colony of *Escherichia coli* in one petri dish. Some of the new colonies show resistance to rifampin.
- ☐ Scientists plate a colony of wild-type *Mycobacterium tuberculosis* and a colony of mutant *Mycobacterium tuberculosis* in one petri dish. Some of the new colonies show resistance to rifampin.
- ☐ Scientists create additional *Mycobacterium tuberculosis* mutants by creating substitution mutations in the DNA that codes for amino acids 36-67. Many of the mutants are resistant to rifampin.

Earning a score point for this item required correctly selecting both the first and the last options, but most students stopped after choosing one response. This type of error could be minimized by adding “mark all that apply” to the item stem.

- Students interactions with simulations should be checked to make sure that the simulations are functioning as intended. For example, a flaw in the simulation for the Texas Weather cluster allowed some students—who knew the proper tools for measuring each phenomenon (e.g., wind speed)—to lose credit for correctly matching tools with phenomena. This occurred because, when these students ran the simulation, they simply manipulated the tools and overlooked the drop-down menu for choosing the phenomenon they intended to measure. The simulation ran as intended under these conditions, so there was nothing to cue the students that they were inadvertently losing points.
- Scoring rubrics should be reviewed to make sure that they are constructed in a consistent manner and conform to the task demands they are intended to measure. In the cognitive interviews, some rubrics awarded a point for meeting a single, straightforward criterion, while others required that the student do several things correctly. For example, in item 1 in the Galilean Moons cluster, students got 1 score point for each of the moons for which they correctly measured the maximum distance from Jupiter. On the other hand, in item 1 of the Redwall Limestone cluster, students had to correctly identify six different animals as being found, or not found, in Arizona to earn any credit.

We recommend that the second type of rubric (requiring students to do several things correctly) be limited to cases in which integration across knowledge is the construct of interest.

### 3.1.2 Cluster Score Distributions and Average Time to Complete, by Grade Level

#### *Elementary School Clusters*

As shown in Table 2, average time to complete the elementary school clusters ranged from six minutes for the Redwall Limestone cluster to 12 minutes for the Desert Plants cluster.

**Table 2. Maximum Score and Average Time to Complete: Elementary School Clusters**

Cluster Name	Maximum Score	Average Time to Complete
Desert Plants	9	12
German Pyramid Candle	4	9
Redwall Limestone	4	6
Terrarium Matter Cycle	9	11

Table 3 and Table 4 show the score distributions for elementary school clusters with maximum scores of four and nine, respectively.

The Redwall Limestone cluster was easy for all students, with 12 students (71%) earning three or 4 score points. Utah students did even better, with half earning the maximum score of four points and two others earning 3 points.

The Desert Plants cluster was also relatively easy, with 15 students (83%) earning at least four of the nine points possible. All six Utah students earned scores in this range. Further, two Utah students were the only ones who earned the maximum score of eight, and four of the five students who earned at least seven points were from Utah.

The Terrarium Matter Cycle cluster was harder for all students, with only four students (22%) earning at least four of the nine points possible. Half of the Utah students earned scores in this range. No student earned the full nine points on this cluster, but the highest scoring student was a Utah student who earned seven points.

The German Pyramid Candle was the hardest cluster, with only one student (from Utah) earning the maximum score of four points (and none earning 3 points). Further, seven students (41%) earned no credit, but only one Utah student was included in this group.

**Table 3. Number of Students Attaining Cluster Total Scores in Specified Range: Elementary School Clusters with Maximum Score = 4**

Cluster Name	Score 4–3	Score 2–1	Score 0
German Pyramid Candle	1	9	7
Redwall Limestone	12	4	1

Desert Plants	5	10	2	1
Terrarium Matter Cycle	1	3	13	1

Note. For both clusters,  $n = 18$ .

### ***Middle School Clusters***

As shown in Table 5, the average time to complete the middle school clusters ranged from 10 minutes for the Galilean Moons cluster to 14 minutes for the Texas Weather cluster.

***Table 5. Maximum Score and Average Time to Complete: Middle School Clusters***

<b>Cluster Name</b>	<b>Maximum Score</b>	<b>Average Time to Complete</b>
Galilean Moons	9	10
Hippos	10	10
Morning Fog	9	12
Texas Weather	11	14

Table 6 through Table 8 show the score distributions for middle school clusters with maximum scores of nine, 10, or, 11, respectively.

Students performed best on the Galilean Moons cluster with five students (42%) earning at least seven points and an additional four students (33%) earning between six and four points.

The Hippos cluster was also fairly easy, with seven students (58%) earning four or more points.

The Morning Fog and Texas Weather clusters (maximum scores nine and 11, respectively) were both challenging for students. Only five students (43%) earned scores greater than three on Morning Fog, and only four students (33%) earned scores greater than three on the Texas Weather cluster.

***Table 6. Number of Students Attaining Cluster Total Sores in Specified Range: Middle School Clusters with Maximum Score = 9***

<b>Cluster Name</b>	<b>Score 9–7</b>	<b>Score 6–4</b>	<b>Score 3–1</b>	<b>Score 0</b>
Galilean Moons	5	4	3	0

### **High School Clusters**

As shown in Table 9, the average time to complete the high school clusters ranged from 10 minutes for the Tuberculosis cluster to 19 minutes for the Blood Sugar Regulation cluster.

**Table 9. Maximum Score and Average Time to Complete: High School Clusters**

Cluster Name	Maximum Score	Average Time to Complete
Blood Sugar Regulation	7	19
Saving the Tuna	7	14
Tomcods	8	17
Tuberculosis	5	10

Table 10 through Table 12 show the score distributions for high school clusters with maximum scores of five, seven, or eight, respectively.

Students found all the high school clusters challenging but performed the worst on the Tomcods cluster. Only one student (7%) earned a score greater than three on this eight-point cluster, and four students (31%) earned no credit. Similarly, there were four students in both the Tuberculosis and Saving the Tuna clusters who earned no credit. No one earned more than 5 points on the seven-point Blood Sugar Regulation cluster, but scores for most students (9 out of 12) were solidly in the mid-range of 5 to 3 points.

## 3.2 DETAILED DISCUSSION BY CLUSTER: ELEMENTARY SCHOOL

### 3.2.1 Cluster 1: Desert Plants

#### *Performance Summary*

The median time to complete the Desert Plants cluster was 11.5 minutes. Table 13 and Table 14 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 13. Number of Students Attaining Cluster Scores in Specified Range: Desert Plants*

Score 9–7	Score 6–4	Score 3–1	Score 0

*Table 14. Number of Students Attaining Item Scores in Specified Range, by Item: Desert Plants*

	Maximum Item Score	Score 1	Score 0
Item 1 (Part A)	1	12	6
Item 1 (Part B)	1	13	5
Item 2 (Part B)	1	3	15

	Maximum Item Score	Score 3	Score 2–1	Score 0
Item 2 (Part A)	3	2	13	3
Item 3	3	14	3	1

*Note.*  $n = 18$ .

Students did relatively well on this cluster, but Item 2 was much more challenging than Items 1 or 3.

#### *Task Demands*

The following are task demands of the Desert Plants cluster:

- Organize or summarize data to highlight trends and patterns and/or determine relationships between the traits of an organism and survival in its environment.
- Understand and generate simple bar graphs or tables that document patterns, trends, or relationships between traits of an organism and its survival in a particular environment.

- Identify patterns or evidence in the data that support inferences about characteristics of an organism and those of its environment.
- Based on the provided data, identify or describe a claim regarding the relationship between the characteristics of an organism and survival in a particular environment.
- Evaluate the evidence to sort relevant from irrelevant information regarding survival of an organism in a particular environment.

## Stimulus

The stimulus for the Desert Plants cluster is shown in Figure 1.

Figure 1. Stimulus: Desert Plants

**Plant Survival in the Desert**
☰

Mesquite trees and cactus plants are both common in the Sonora Desert of North America, even though this region receives less than 15 inches of rain a year. In comparison, bird's nest ferns are common to the rainforests of southeastern Asia, where rainfall is often more than 100 inches a year.

These three plants have differences in their roots, stems, and leaves. The Characteristics of Plants table summarizes the characteristics of each type of plant.

**Characteristics of Plants**

	<b>Mesquite Tree</b>	<b>Cactus Plant</b>	<b>Bird's Nest Fern</b>
Roots	Long deep roots	Wide shallow roots	Short shallow roots
Stems	Non-expandable trunk	Thick expandable trunk	Thin stems
Leaves	Small leaves	Leaves reduced to thin spikes	Large leaves

Plants use their roots, stems, and leaves to get and keep water. Differences in these structures affect the way in which different plants meet their needs for water.

**Effect of Plant Structures on Ability to Get and Keep Water**

<b>Plant Structure</b>	<b>Effect</b>
Roots	Deep roots—allow plants to reach ground water below surface Wide shallow roots—allow plants to absorb a lot of water quickly when it rains
Leaves	Small waxy leaves—prevent loss of water in the hot sun
Stems	Thick expandable stems—allow plants to store water

To test how different characteristics affect a plant's ability to survive with less than 15 inches of rain a year, scientists planted Mesquite trees, cactus plants, and bird's nest ferns in a desert environment. A year later, they recorded how many of each type of plant survived.

### Start of Experiment

### End of Experiment

In the questions that follow you will construct an argument for why some plants survive better in the desert than others.

## Details by Item

### Item 1

Item 1 of the Desert Plants cluster is shown in Figure 2.

*Figure 2. Item 1: Desert Plants*

The following question has two parts. First, answer part A. Then, answer part B.

Use the data from the experiment to compare the survival of the three types of plants in the desert.

#### Part A

Record the data from the experiment by adding numbers to the table.

	Mesquite Trees	Cactus Plants	Bird's Nest Ferns
Number of plants at start of experiment	<input type="text"/>	<input type="text"/>	<input type="text"/>
Number of plants at end of experiment	<input type="text"/>	<input type="text"/>	<input type="text"/>

#### Part B

Select the **two** statements that are supported by the data in the table you created.

- ☐ All types of plants can survive in all environments.
- ☐ No types of plants can survive in a dry desert environment.
- ☐ All types of plants can survive in the dry desert environment.
- ☐ Some types of plants cannot survive in the dry desert environment.
- ☐ Some types of plants survive better than others in the dry desert environment.

### Item 1 (Part A)

#### SCORES

Half of the California students (six) and all of the Utah students (six) earned credit (1 score point) on Part A.

#### COMPREHENSION

Those students who received credit for this item did not appear to be confused by any features of the item.

However, the students who did not receive credit seemed to have a general lack of comprehension of what was being asked. For example,

- one student wrote incoherent sentences instead of numbers;
- a second student decided to start at 27 “as a random number to start with”; and

- a third student said, “For mesquite trees, I got the start of experiment 1, do you see you start with 1, and at the end I saw how much they had altogether, and I got 3, so I was guessing that’s how much it was.” For the cactus plants, the student said, “I thought the same thing—they started off with 1 then ended with 3.” For the bird’s nest ferns, he said, “I was thinking the same thing because I was looking at the characteristics of plants—you start with 1 then you end with 3.”

## REASONING

The 12 students who earned credit all made sensible use of the experiment data.

For example, one student said she counted the trees, plants, and ferns in the *Start of the Experiment* exhibit and began entering the numbers in the first row of the table. She explained, “I put 5 mesquite trees, because when I counted, there was 5 [at the beginning of the experiment]. When I counted the cactus, there was 5. And then the same for bird’s nest ferns.” She counted the trees, plants, and ferns in the *End of the Experiment* exhibit and began entering the numbers in the second row of the table. The student noted that there were four mesquite trees, explaining that this was “[b]ecause one of them had died during the experiment. And then for the cactus plants, the number stayed the same, at 5, because they normally live there, like, a lot, and they really don’t need a lot of water to survive. And then the bird ferns all died during the experiment, so then that is a total of 0.”

## Item 1 (Part B)

### SCORES

Thirteen students, including five of the six Utah students, earned credit (1 point) on Part B, which required them to identify two statements that are supported by the table in Part A. (One of these students did not receive credit for Part A but understood the general concept.)

### COMPREHENSION

No features of this item appeared to confuse students.

### REASONING

Most students used credible reasoning from evidence to reach a solution.

For example, one student chose the second-to-last option (*[s]ome types of plants cannot survive in the dry desert environment*) because “at the start of the experiment, there was a total of five bird’s nest ferns and then they all died, and also because one of the mesquite trees – they died – but I mean, most of them still remained.” And she chose the last option (*[s]ome types of plants survive better than others in the dry desert environment*) because “out of all three of the plants, the cactus all lived instead of dying.” She shared that she did not choose the first option (*[a]ll types of plants can survive in all environments*) because “As you can see, some of them died – like the bird’s nest ferns and the mesquite trees.” She shared that she did not choose the second option (*[n]o types of plants can survive in a dry desert environment*) “because the cactus – they still lived.” She shared that she did not choose the third option (*[a]ll types of plants can survive in the dry desert environment*) “because the bird’s nest ferns died.”

**Item 2**

Item 2 of the Desert Plants cluster is shown in Figure 3.

*Figure 3. Item 2: Desert Plants*

The following question has two parts. First, answer part A. Then, answer part B.

Determine which traits of the three types of plants affect their survival in the desert.

**Part A**

The three tables show traits of each type of plant from the experiment. Select the boxes to identify whether each trait helps or does not help each plant survive in the desert.

**Mesquite Tree Traits**

	Helps Survival	Does Not Help Survival
Long deep roots	<input type="checkbox"/>	<input type="checkbox"/>
Non-expandable trunk	<input type="checkbox"/>	<input type="checkbox"/>
Small leaves	<input type="checkbox"/>	<input type="checkbox"/>

**Cactus Plant Traits**

	Helps Survival	Does Not Help Survival
Wide shallow roots	<input type="checkbox"/>	<input type="checkbox"/>
Thick stem	<input type="checkbox"/>	<input type="checkbox"/>
Thin spikes as leaves	<input type="checkbox"/>	<input type="checkbox"/>

**Bird's Nest Fern Traits**

	Helps Survival	Does Not Help Survival
Short shallow roots	<input type="checkbox"/>	<input type="checkbox"/>
Thin stem	<input type="checkbox"/>	<input type="checkbox"/>
Large leaves	<input type="checkbox"/>	<input type="checkbox"/>

**Part B**

Type a number into each box to identify the number of traits that help or do not help the plants survive, based on the tables in part A.

	Helps Survival	Does Not Help Survival
Mesquite Trees	<input type="text"/>	<input type="text"/>
Cactus Plants	<input type="text"/>	<input type="text"/>
Bird's Nest Ferns	<input type="text"/>	<input type="text"/>

**Item 2 (Part A)****SCORES**

Points were awarded based on the number of plants for which the student correctly identified the traits that help the plant survive. Two students earned 3 score points (full credit) on Part A, six students earned 2 score points, and seven students earned 1 score point.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

Nine of the students used the *Characteristics of Plants* and *Effects of Plant Structures on Ability to Get and Keep Water* tables, and at least three of these students also referred to the exhibits showing plants that were alive at the beginning and end of the experiment. However, they did not necessarily interpret all the data correctly. For example, the following student referenced the information in the stimulus tables frequently and appropriately but misinterpreted some of the data. She did not appear to use the exhibits on the start and end of the experiment to check her understanding of which traits help or hinder survival.

- For the mesquite tree she said, “the mesquite tree has long deep roots and also has small leaves,” and checked *Helps Survival* for roots and leaves. She continued, “The [mesquite] plant—I don’t think that the non-expandable trunk will help. It says that thick expandable stems allow plants to store water, except the tree doesn’t have one, so it can’t store a lot of water, so I don’t think that will help it survive.” She checked *Does Not Help Survival* for the non-expandable trunk.
- For the cactus plant she said, “The cactus plant traits, it says it has wide shallow roots that allow the plant to absorb lots of water when it rains. So that would help it survive.” She checked *Helps Survival* for roots. She continued, “The thick trunk also will, but thick stem would do that.” She checked *Helps Survival* for trunk. She continued, “Then thin spikes as leaves—that probably wouldn’t help them a lot.” She checked *Does Not Help Survival* for leaves.
- For the bird’s nest fern she said, “So for the bird’s nest fern traits, it has shallow roots, and shallow roots allow it to absorb a lot of water when it rains, so that would probably help survive.” She checked *Helps Survival* for roots. She continued, “A thin stem—that would probably not help it survive since the thin stem would not be able to hold a lot of water to help it survive.” She checked *Does Not Help Survival* for the stem. She continued, “Then large leaves—that would probably be good. And small waxy leaves have lots of water in the hot sun. Yep.” She checked *Helps Survival* for leaves.

Seven students made little or no use of the data in the stimulus and based their reasoning for Part A on prior knowledge or conjecture.

**Item 2 (Part B)****SCORES**

On Part B, most students quickly filled out the table on the number of traits that help or do not help each plant survive based on their responses in Part A.

However, only three students completed all six cells correctly, as required to earn credit (1 score point) on Part B.

**COMPREHENSION**

On Part B, three students wrote the types of traits in the response fields (e.g., long deep roots) rather than the number of traits as indicated in the instructions. One student also wrote some extraneous text. One other student wrote text that was mostly incoherent.

**Item 3**

Item 3 of the Desert Plants cluster is shown in Figure 4.

*Figure 4. Item 3: Desert Plants*

Complete each statement to explain the survival of the three types of plants in the desert.

Click on each blank box to select the words or phrases that **best** complete each statement.

The Mesquite tree  in the desert because all or most of its characteristics  the tree meet the challenges of living in the desert.

The Cactus plant  in the desert because all or most of its characteristics  the plant meet the challenges of living in the desert.

The Bird's Nest Fern  in the desert because all or most of its characteristics  the fern meet the challenges of living in the desert.

**SCORES**

Students earned 1 point for each statement they completed correctly. Fourteen students completed all three statements correctly and earned full credit. This included all six of the Utah students.

Sixteen students earned a score point for the statement on the mesquite tree. Sixteen students earned a score point for the statement on the cactus plant, and 15 students earned a score point for the statement on the bird's nest fern.

**COMPREHENSION**

All students navigated through this item with ease.

**REASONING**

Most students used their answers to previous questions in the cluster to select responses from the drop-down menus. At least five students used information from the stimulus, and three students used prior knowledge.

The following is an example of a student who reasoned appropriately from the evidence in the stimulus to respond to Item 3:

The student selected *survived well* for mesquite tree, explaining that this was “because all or most of its characteristics helped the tree meet the challenges of living in the desert; because the characteristics, such as having the long deep roots and the small leaves can help it survive in the desert.” She selected *survived best* for cactus plant, “because all or most of its characteristics helped it meet the challenges of living in the desert; because, of all of the plants, it stayed alive, and the characteristics such as having wide shallow roots and thick stems helped it live.” The student selected *did not survive* for bird’s nest fern, noting that “only one of its traits helped, and the rest—the two other ones—did not help it.” Then she selected the answers for the second part of each item, choosing *helped* for mesquite tree, *helped* for cactus plant, and *did not help* for bird’s nest fern.

### 3.2.2 Cluster 2: German Pyramid Candle

#### *Performance Summary*

The median time to complete the German Pyramid Candle cluster was nine minutes. Table 15 and Table 16 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 15. Number of Students Attaining Cluster Total Scores in Specified Range:  
German Pyramid Candle*

Score 4–3	Score 2–1	Score 0
1	9	7

*Note.* Maximum score = 4.  $n = 17$ ; one student ran out of time before attempting this cluster.

*Table 16. Number of Students Attaining Item Scores in Specified Range, by Item:  
German Pyramid Candle*

	Maximum Item Score	Score 2	Score 1	Score 0
Item 1	2	3	5	9

	Maximum Item Score	Score 1	Score 0
Item 2	1	2	15
Item 3	1	5	12

*Note.*  $n = 17$ ; one student ran out of time before attempting this cluster.

This was the most difficult of the elementary school clusters; only one student (from Utah) earned full credit (4 points).

#### *Task Demands*

The following are task demands of the German Pyramid Candle cluster:

- Identify from a list, including distractors, the materials/tools needed for an investigation of how energy is transferred from place to place through heat, sound, light, or electric currents.
- Identify the outcome data that should be collected in an investigation of how energy is transferred from one place to another through heat, sound, light, or electric currents.
- Make and/or record observations about the transfer of energy from one place to another via heat, sound, light, or electric currents.
- Interpret and/or communicate the data from an investigation.

- Select, describe, or illustrate a prediction made by applying the findings from an investigation.

### ***Stimulus***

The stimulus for the German Pyramid Candle cluster is shown in Figure 5.

**Figure 5. Stimulus: German Pyramid Candle**

A German pyramid candle is a decoration whose parts only move when the candles are lit. The parts that move are driven by a fan that sits on the top of the pyramid. As the fan turns, other parts of the pyramid turn. The animation shows an example of a German pyramid candle. Click the small gray arrow to begin the animation.

Use the following questions to determine how energy is transferred from the candles to the fan blades.

### ***Details by Item***

#### **Item 1**

Item 1 of the German Pyramid Candle cluster is shown in Figure 6.

**Figure 6. Item 1: German Pyramid Candle**

In the following table, select the **two** pieces of data that explain how the candles affect the fan, and then use the animation to describe the relationship between these two variables.

**Relationship of Outcome Data**

Variables	Relationship
<input type="text"/>	<input type="text"/>
<input type="text"/>	<input type="text"/>

## SCORES

Two (Utah) students earned full credit (2 score points) on this item, which required students to identify two variables that explain the influence of the candles on the fan and then describe the relationship between these variables.

Seven other students earned partial credit for selecting the two correct variables but not correctly specifying the relationships—five were Utah students.

Additional students selected at least one of the correct variables.

A total of 13 students correctly selected the temperature of the air between the blades and the candles as one of the variables, and eight students correctly selected the rotation speed of the blade.

## COMPREHENSION

Students clearly did not understand how to describe the relationship between the two variables as only four students entered any responses to this part of the question. It is not clear how much of the confusion was because the students did not understand how energy was transferred and how much of the confusion was due to not understanding what the question was asking.

Five students were hesitant about the entire item, and two students tried to guess at the relationships between the two variables because they did not really understand what “the relationship” meant.

## REASONING

Most students tried to reason their way to a solution but lacked the content knowledge to do so without error. The following shows the reasoning process for one student who exemplifies this:

The student said, “The first variable is probably going to be *brightness* because if they’re more brighter, it probably means that it’s hotter. And for relationship, I’m going to do *increase* because I think it turns because something is taking in the heat energy and it’s using the heat energy from the candles to rotate the fan, and that’s why the brightness of the candles would probably increase the speed of the rotation of the fans. And so for variable two, I’m going to do the *temperature of the air between the blades and the candles* – I chose that because if the air is colder or cooler, it’s probably not going to rotate that much because it takes in the heat energy that the candles create and it rotates them . . . And if it’s like hot or warm, it’s probably going to rotate faster . . . if I’m correct. And for the relationship, I’m going to do decrease because if it’s slower or cooler, it’s probably going to be less . . . or not as fast as if it was warmer.”

**Item 2**

Item 2 of the German Pyramid Candle cluster is shown in Figure 7.

**Figure 7. Item 2: German Pyramid Candle**

Use the table below to correctly order the statements based on what you have observed. Use the numbers 1 through 4 to order your statements, 1 being the first step and 4 being the last step. Use the "-" sign to indicate that the statement is not a part of the process you observed.

Step	Statement
<input type="text"/>	Air moves upward past the fan blades
<input type="text"/>	Light from candles transfers energy to the air
<input type="text"/>	Air gets hotter
<input type="text"/>	Moving air transfers energy to the fan blades
<input type="text"/>	Air transfers heat energy to the fan blades
<input type="text"/>	Heat from candles transfers energy to the air
<input type="text"/>	Light energy carries the air upwards past the fan blade

**SCORES**

All but one student observed the whole animation, but only two (Utah) students earned credit (1 score point) on this item by correctly ordering the steps based on what they observed in the animation.

**COMPREHENSION**

One student did not seem to understand that he was to order the steps, and it was not clear how he selected the numbers for his responses.

**REASONING**

Students had the same issues with lack of content knowledge as they did with Item 1.

For example, one student correctly chose *[h]eat from candles transfers energy to the air* for step 1 (noting that “the energy carries the air upward past the fan”), but faltered after that. She chose *[a]ir transfers heat energy to the blades* for step 2, noting that it “was going to the fan blades.” For step 3, the student initially chose *[a]ir moves upward past the fan blades* but changed it to *[l]ight energy carries the air upwards past the fan blade*. When prompted later to explain why she changed her answer, she explained, “Because it made more sense if hot air moved upward past the fan blades, but it was just air, so I was thinking light energy carries the air upward past the fan blades because first the energy goes to the fan blades and then the light energy from the candles goes past the fans.” For step 4, she thought for a moment and said, “I think this (*air gets hotter*), and chose it,” explaining “because it goes around more.”

**Item 3**

Item 3 of the German Pyramid Candle cluster is shown in Figure 8.

*Figure 8. Item 3: German Pyramid Candle*

With your knowledge of the process that drives the German pyramid candle, select the boxes in the table to indicate whether or not the changes listed would affect the animation.

	<b>Affect</b>	<b>Not Affect</b>
<b>Change the number of candles</b>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Remove the air from between the candles and the blades</b>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Change the amount of wax on the candles</b>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Change the angle of the blades</b>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Change the color of the fan blades</b>	<input type="checkbox"/>	<input type="checkbox"/>

**SCORES**

Five students earned credit (1 score point) for this item.

Nine other students correctly classified four of the five changes, but earned no credit, based on the scoring rubric.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

As with the other items in this cluster, students needed prior content knowledge to reason their way to a correct solution. For example, one student, who had most of the requisite knowledge, said,

“For the first one, the *change in number of candles*, I think that, with more heat and light, I think it will affect it a little bit more by making the blades spin faster. *Removing the air from between the candle and blades*, I think that will affect it because the GPC probably takes in the air from what’s underneath it. For the third one, the *change in the amount of wax on the candles*, I think that will not affect it because the wax just increases the duration of the candle, which wouldn’t affect it. *Change the angle of the blades*, I don’t think that would affect it because if you just turn the blades over to at least an angle where it looks like it’s even, I don’t think that will affect it either. *Change the color of the fan blades*, I don’t think changing the color of the fan blades would affect it because it’s just color, and it’s for decoration most of the time.”

### 3.2.3 Cluster 3: Redwall Limestone

#### *Performance Summary*

The median time to complete the Redwall Limestone cluster was six minutes. Table 17 and Table 18 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 17. Number of Students Attaining Cluster Total Scores in Specified Range: Redwall Limestone*

Score 4–3	Score 2–1	Score 0
12	4	1

*Note.* Maximum score = 4;  $n = 17$ ; one student ran out of time before attempting this cluster.

*Table 18. Number of Students Attaining Item Score in Specified Range, by Item: Redwall Limestone*

	Score 1	Score 0
Item 1	13	4
Item 2	13	4
Item 3 (Part A)	14	3
Item 3 (Part B)	7	10

*Note.* Maximum score for each item = 1;  $n = 17$ ; one student ran out of time before attempting this cluster.

#### *Task Demands*

The following are task demands of the Redwall Limestone cluster:

- Organize or summarize data to highlight trends, patterns, or correlations between plant and animal fossils and the environments in which they lived.
- Generate graphs or tables that document patterns, trends, or correlations in the fossil record.
- Identify evidence in the data that support inferences about plant and animal fossils and the environments in which they lived.

## Stimulus

The stimulus for the Redwall Limestone cluster is shown in Figure 9.

*Figure 9. Stimulus: Redwall Limestone*

The Grand Canyon is a huge canyon located in Arizona. The canyon has been formed by the Colorado River. The river has cut down into the ground, exposing rock layers that were deposited millions of years ago. The picture shows part of the Grand Canyon.

**Portion of Grand Canyon**

One of these rock layers is called the Redwall Limestone. The Redwall Limestone contains many different fossils, including corals, clams, octopi, and fish.

In the questions that follow, you will study six animals in order to learn about what Arizona was like when the Redwall Limestone was deposited millions of years ago.

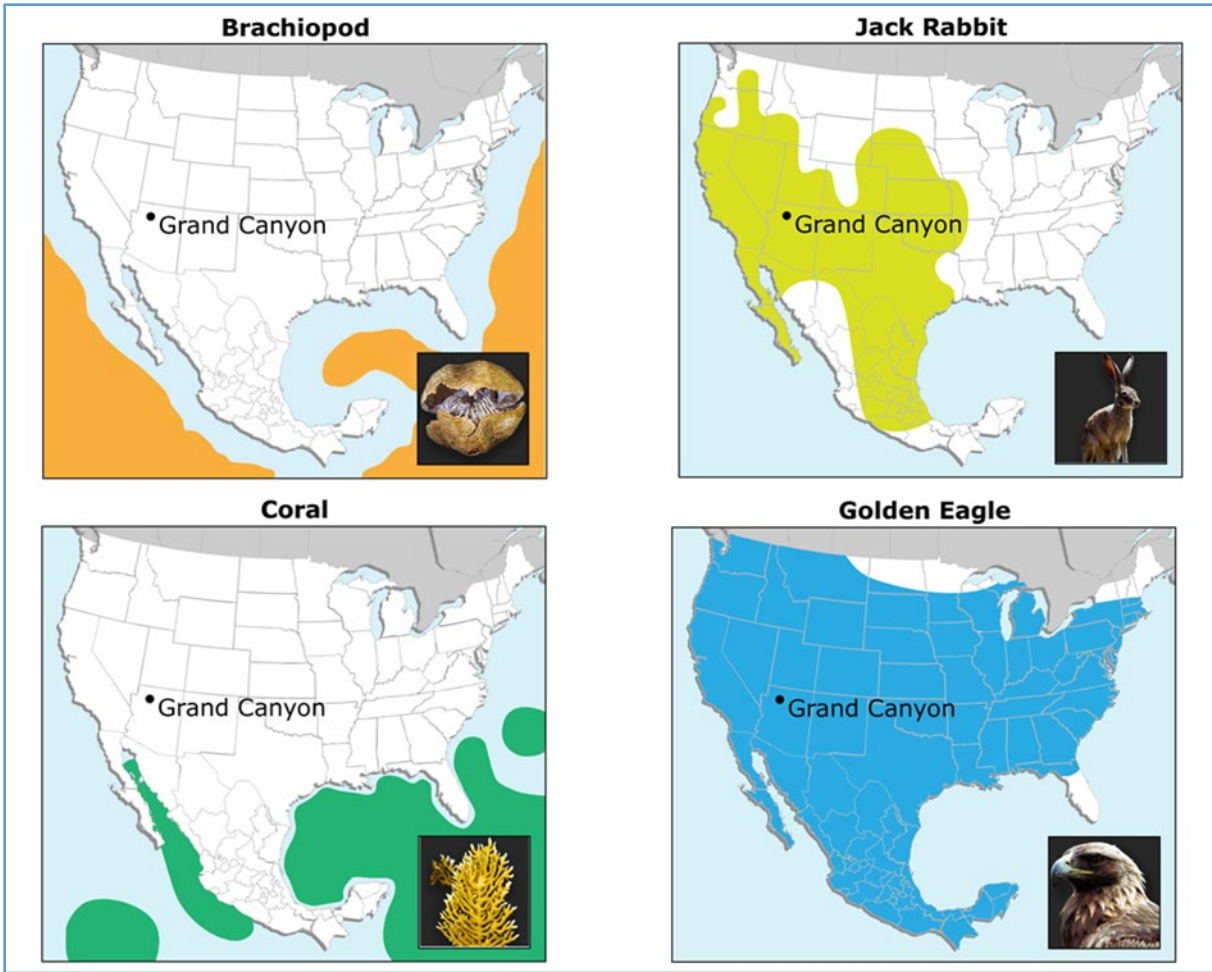

The pictures show the animals and maps of where they are found. The colored regions show where the animals live.

**Bighorn Sheep**

**Octopus**

Despite some incorrect responses, nearly all the students seemed comfortable navigating through the maps to decide where the animals are found and filling out the tables in Items 1 and 2. One student did not make any use of the maps.

## Details by Item

### Item 1

Item 1 of the Redwall Limestone cluster is shown in Figure 10.

*Figure 10. Item 1: Redwall Limestone*

Using the given maps, complete the table by identifying whether each animal is found in Arizona.

	Found in Arizona	Not Found in Arizona
Bighorn Sheep	<input type="checkbox"/>	<input type="checkbox"/>
Octopus	<input type="checkbox"/>	<input type="checkbox"/>
Brachiopod	<input type="checkbox"/>	<input type="checkbox"/>
Jack Rabbit	<input type="checkbox"/>	<input type="checkbox"/>
Coral	<input type="checkbox"/>	<input type="checkbox"/>
Golden Eagle	<input type="checkbox"/>	<input type="checkbox"/>

### SCORES

Thirteen students earned credit (1 score point) on this item.

### COMPREHENSION

No features of this item appeared to confuse students.

### REASONING

Ten of the 13 students who earned credit showed evidence in the think-aloud of using the maps to reason their way to a solution, as intended.

For example, one student

- selected *Found in Arizona* for bighorn sheep “because the map that it gives you shows you that it’s located in Arizona.”
- selected *Not Found in Arizona* for octopus, explaining that “It’s found in oceans – not really in the state.”
- selected *Not Found in Arizona* for brachiopod, noting, with a laugh, “Because it’s in the oceans, not the state – like the octopus . . . octopi.”
- selected *Found in Arizona* for jack rabbit “because the map that it gives you shows it’s located in Arizona.”
- selected *Not Found in Arizona* for coral because “the map that it gives you has those green things that shows you that it’s not located in Arizona.”
- selected *Found in Arizona* for the golden eagle, noting that “the blue is all over the United States, so yeah, it’s in Arizona.”

Among the four students who did not earn credit for this item, each mis-located two of the six animals. The think-alouds showed that three of these students formed their answers based on background knowledge and some educated guessing rather than using the maps.

For example, one student

- selected *Not Found in Arizona* for bighorn sheep because “When I went to Arizona, I’ve never seen a bighorn sheep over there, so I really think it is not in there.”
- selected *Found in Arizona* for jack rabbit, explaining that “it’s in there because I’ve seen one when I went to Arizona.”
- selected *Not Found in Arizona* for coral. This choice appeared to be at random, marked after the student said, “I’ve never heard of that animal too because in school we don’t really learn about coral and so yeah I’ve never heard of it and I don’t know if they’re ever in Arizona, so . . .”
- selected *found in Arizona* for golden eagle because “I think it’s in Arizona because our school mascot is the golden eagle and they always say golden eagles are from Arizona.”

## **Item 2**

Item 2 of the Redwall Limestone cluster is shown in Figure 11.

*Figure 11. Item 2: Redwall Limestone*

Using the given maps, complete the table by selecting whether each animal lives on land or in water.

Animal	Environment
Bighorn Sheep	<input type="text"/>
Octopus	<input type="text"/>
Brachiopod	<input type="text"/>
Jack Rabbit	<input type="text"/>
Coral	<input type="text"/>
Golden Eagle	<input type="text"/>

## **SCORES**

Thirteen students earned credit (1 score point) on this item.

## **COMPREHENSION**

No features of this item appeared to confuse students. All students worked through the item fairly quickly, and three of the students commented that it was easy.

## **REASONING**

Among the 13 students who earned credit, most did not appear to make much use of the maps in formulating their responses, apparently because they felt that they could easily respond based on background knowledge about the animals.

For example, one student shared that she knows bighorn sheep live on land and that octopi are living in the water. But then she noted that she wasn't sure about coral, adding, "Sometimes you see coral on the beach or somewhere else, and so I don't know if it's land or water. But maybe it was washed up on the beach, so I was thinking water."

Students who did not earn credit for this item mis-located either the brachiopod or the coral; one student also mis-located the golden eagle. These students also relied on background knowledge for their responses. For example, one student explained his choices as follows:

- The bighorn sheep "is on land because I don't think he'll make it in the water."
- The octopus "has to live in the water to survive."
- The brachiopod "has to live in the water because it looks like a jellyfish and jellyfishes have to live in the water, so I thought maybe that does too, and I looked at the picture and thought it has to live in the water."
- "I looked at [the jack rabbit], and that's a land animal, and regular rabbits live on land, and that's why I picked that one."
- "[The coral] has to be on land because it kind of looks like a tree and trees have to be on land."
- "Birds and eagles are on land, so I picked that eagle to be on land, so I just knew it from my knowledge."

**Item 3**

Item 3 of the Redwall Limestone cluster is shown in Figure 12.

*Figure 12. Item 3: Redwall Limestone*

The following question has two parts. First, answer part A. Then, answer part B.

**Part A**

Within the Grand Canyon, a rock layer contains fossils of octopi (plural of “octopus”), brachiopods, and corals. What can you conclude about the environment of the Grand Canyon region from the fossil evidence?

- Ⓐ The Grand Canyon region was always desert.
- Ⓑ The Grand Canyon region was once underwater.
- Ⓒ The Grand Canyon region experienced a lot of rain.
- Ⓓ The fossils do not provide any information about the environment.

**Part B**

Which statement supports your conclusion?

- Ⓐ The rock layer contains fossils of only animals that live in water.
- Ⓑ The rock layer contains fossils of only animals that live on land.
- Ⓒ The rock layer contains fossils of animals that live neither on land nor in water.
- Ⓓ The rock layer contains fossils of animals that live on land and animals that live in water.

**Item 3 (Part A)****SCORES**

Fourteen students earned credit (1 score point) on this sub-item.

There was no common theme to the wrong answers—there were three possible wrong answers, and each of the three students who failed to earn credit chose a different one.

**COMPREHENSION**

Among the three students who did not earn full credit for the sub-item, one student appeared not to understand what the question was asking. She said she was confused on how to respond because “I thought it was going to ask me ‘does it usually rain there?’ and it doesn’t usually rain there because it’s in Arizona.”

**REASONING**

The 14 students who earned credit for this sub-item (1 score point) all appeared to evaluate the possible response option against credible criteria as they reasoned their way to a solution.

For example, one student first read option A, *[t]he Grand Canyon region was always desert*, out loud. Then he said he wanted to check the next option and read *[t]he Grand Canyon region was once underwater*. The student said that option B could be the answer, “but the first option [A] is not because it said in the question [the fossils] were sea animals.” The student then read option C, *[t]he Grand Canyon region experienced a lot of rain*, and option D, *[t]he fossils do not provide any information about the environment*. He said that it can’t be option D because “[the question] doesn’t have anything to do with the animals that are living today.” He said it probably wasn’t option C because “even if it rained, [but] it wasn’t an ocean, then the coral couldn’t live there.” The student concluded that the correct answer had to be B.

### **Item 3 (Part B)**

#### **SCORES**

Seven students earned credit (1 score point) on this sub-item.

#### **COMPREHENSION**

Among the 10 students who did not earn credit on this sub-item, most appeared to be confused as to what the question was asking. Rather than associating the question with Part A, these students appeared to be trying to answer a separate question about the types of animal fossils that might be found in the canyon walls. Further, they did not seem to know where to look for information that would help them answer the question; they tended to reference the list of *current-day* animals mentioned in the stimulus, and to do so irrespective of whether these animals were found in Arizona. Consequently, nine of these 10 students selected option D, *[t]he rock layer contains fossils of animals that live on land and animals that live in water*, using reasoning such as the following:

One student said, “obviously C, *the rock layer contains fossils of animals that live neither on land nor in water*, is wrong, it’s not only water because they have jack rabbits, the goat-ram thing, and the eagle so that’s not true.” For option B, *the rock layer contains fossils of only animals that live on land*,” he said: “that’s not true, there are octopus, coral and brachiopod.” He read out loud response option C a second time, *the rock layer contains fossils of animals that live neither on land nor in water*, and said “the bird does live on land and it flies a lot, but it’s still on land, so it has to be D, *the rock layer contains fossils of animals that live on land and animals that live in water*.”

Some students also seemed to have problems with the structure of the answer choices (A, or B, or neither A nor B, or both A and B).

For example, one student said, “What I found confusing was this one since I was looking at D and it said, ‘live in water’ at the end, just like A, so I was looking at it, and I figured out that it said lived on land AND on water. It kind of confused me just looking at the end that both of them said ‘live in water.’”

#### **REASONING**

The seven students who earned credit for this sub-item all appeared to use credible criteria in reasoning their way to a solution.

For example, one student read out loud the stem and option A, *[t]he rock layer contains fossils of only animals that live in water*. He said that it could be that one, but he wanted to read the other options. He read out loud option B, *[t]he rock layer contains fossils of only animals that live on land*. The student said, “no, it wouldn’t be that one because the answer [to Part A] doesn’t have anything to do with that.” He read option C, *[t]he rock layer contains fossils of animals that live neither on land nor in water*, and said it couldn’t be the right answer, because the question says that [the rock layer] has sea animals. He read option D, *[t]he rock layer contains fossils of animals that live on land and animals that live in water*. The student said that “the question never said anything about that part” and chose A.

### 3.2.4 Cluster 4: Terrarium Matter Cycle

#### *Performance Summary*

The median time to complete the Terrarium Matter Cycle cluster was 11 minutes. Table 19 and Table 20 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 19. Number of Students Attaining Cluster Total Scores in Specified Range: Terrarium Matter Cycle*

Score 9–7	Score 6–4	Score 3–1	Score 0
1	3	13	1

*Note.* Maximum score = 9;  $n = 18$ .

*Table 20. Number of Students Attaining Item Scores in Specified Range, by Item: Terrarium Matter Cycle*

	Maximum Item Score	Score 1	Score 0
Item 1 (Part A)	1	3	15
Item 1 (Part B)	1	6	12
Item 2 (Part A)	1	8	7
Item 2 (Part C)	1	1	17
Item 2 (Part D)	1	1	17
Item 3	1	7	11

	Maximum Item Score	Score 3	Score 2–1	Score 0
Item 2 (Part B)	3	3	10	5

*Note.*  $n = 18$

Earning credits on this cluster was challenging for the students. Two of the Utah students earned the most credit (seven and six credits respectively), likely reflecting their greater exposure to NGSS-based instruction.

#### *Task Demands*

The following are task demands of the Terrarium Matter Cycle cluster:

- Select or identify from a collection of potential model components, including distractors, the parts of a model needed to describe the movement of matter among plants, animals, decomposers, and the environment.

- Manipulate the components of a model to demonstrate properties, processes, and/or events that result in the movement of matter among plants, animals, decomposers, and the environment including the relationships of organisms and/or the cycle(s) of matter and/or energy.
- Articulate, describe, illustrate, select, or identify the relationships among components of a model that describe the movement of matter among plants, animals, decomposers, and the environment.
- Make predictions about the effects of changes in model components including the substitution, elimination, or addition of matter and/or an organism and the result.

### Stimulus

The stimulus for the Terrarium Matter Cycle cluster is shown in Figure 13.

Figure 13. Stimulus: Terrarium Matter Cycle

A science class sets up four terrariums on a sunny windowsill. Each terrarium contains water and insects. Each one also contains a combination of gravel, soil with bacteria, and/or plants according to the Terrarium Setups table.

**Terrarium Setups**

	<b>Terrarium 1</b>	<b>Terrarium 2</b>	<b>Terrarium 3</b>	<b>Terrarium 4</b>
<b>Soil</b>			X	X
<b>Gravel</b>	X	X		
<b>Plants</b>		X		X

The students observe the terrariums every 5 days for 15 total days and record observations of the insects and plants. Their data are shown in the Terrarium Observations diagrams.

**Terrarium 1  
Observations**

Day	Insects
1	Alive
5	Not alive
10	Not alive
15	Not alive

**Terrarium 2  
Observations**

Day	Insects	Plants
1	Alive	Alive
5	Alive	Alive
10	Alive	Not alive
15	Not alive	Not alive

**Terrarium 3  
Observations**

Day	Insects
1	Alive
5	Not alive
10	Not alive
15	Not alive

**Terrarium 4  
Observations**

Day	Insects	Plants
1	Alive	Alive
5	Alive	Alive
10	Alive	Alive
15	Alive	Alive

In the following questions, you will develop a model to show why the insects only survive under certain environmental conditions.

## Details by Item

### Item 1

Item 1 of the Terrarium Matter Cycle cluster is shown in Figure 14.

Figure 14. Item 1: Terrarium Matter Cycle

The following question has two parts. First, answer part A. Then, answer part B.

#### Part A

Based on the observations of the terrariums, identify the parts that must be present for the insects to survive.

	Must be present
Gravel	<input type="checkbox"/>
Soil with Bacteria	<input type="checkbox"/>
Water	<input type="checkbox"/>
Insects	<input type="checkbox"/>
Plants	<input type="checkbox"/>

#### Part B

Select the **three** statements that explain why these parts are necessary for the insects to survive.

- ☐ Insects need plants for food.
- ☐ Insects need soil to lay their eggs in.
- ☐ Plants need nutrients from the soil.
- ☐ Gravel is necessary for water drainage.
- ☐ Water is necessary for all living organisms.
- ☐ All living organisms take in matter from the environment.
- ☐ Different types of organisms are necessary for stable ecosystems.

### Item 1 (Part A)

#### SCORES

Three students earned credit (1 score point) on this sub-item, which required them to correctly identify all four of the elements that must be present for the insects to survive. Ten other students correctly identified three of the four parts.

## COMPREHENSION

Several students had trouble with the concept that the organism itself (i.e., insects) was one of the things that had to be present for that organism to survive. Six students gave a response that correctly identified soil with bacteria, water, and light as essential, but left out insects. Some others chose insects, but interpreted it as other insects, or were not sure.

For example, when the interviewer asked after the think-aloud, “You weren’t sure whether to click insects or not here. Could you tell me a little about that?” One student said, “Yeah. Would it be the insects themselves? Or would it be different insects? Like you’d put two cockroaches in there with a ladybug. Or you’d put two ladybugs with a spider. I don’t know. If insects have to be there to survive, then yes, but if it is different insects and they’d be harmless, then I’d say no, they don’t need to be there. So maybe more description there.”

## REASONING

The three students who received credit for the sub-item displayed the type of reasoning from evidence that was expected, although their reasoning was not necessarily correct in every detail.

For example, one student said, “I know a class sets up four terrariums by a sunny windowsill, so light can get in to help the plants. I know plants have a photosynthesis process, and they need the sun to make food. There are also insects so they can eat, and water so they can drink, and soil so they can have a stable root because I know that plants don’t need soil to grow. In terrarium 3 and 4 there is soil, and in terrarium 1 and 2 there is gravel, and in 2 and 4 there are plants. A student observes the terrarium every 5 days for 15 days and records observation. Three times he observes them to collect observation—like the two living things in there, like the insects and the plants, and the data is shown on the diagram. I can see that the day 1 the insects are alive because in terrarium 1 there is only gravel, but no plants, so they don’t have anything to eat, so they can only survive about a day. Day 1, the insects are alive because—they are alive for three checks because they have gravel and plants . . . . The plants dying would probably be because maybe gravel is not strong to hold their roots. If the plants die, so do the insects. In terrarium 3, the insects are alive, and they all die on the next days because they don’t have any plants to eat. And then terrarium 4 has plants and soil, so it has plenty for the insects to eat, and it is a good support for the plants, so if they both stay alive, they can feed off each other.”

Many students who did not receive credit made only limited use of the experimental data provided in the stimulus and relied entirely or primarily on background knowledge.

For example, for *Gravel*, one student said, “I don’t think it should be present because, if you just need gravel, you would have nothing to do with the soil in there.” For *Soil with Bacteria* the student said, “It must be present because a lot of plants and flowers, they need soil—and they also have bacteria in it or something.” For *Water*, the student said, “It definitely needs to be present because with just sun and soil, it won’t let it grow because every plant needs water, soil, and sun.” For *Insects*, the student said, “Yeah, because bees like going on sunflowers, so yeah it could be present.” For *Plants*, the student said, “Not so much cause if you’re going to grow one it’s already present . . . .” When asked if this was from the student’s prior knowledge, she agreed.

**Item 1 (Part B)****SCORES**

Six students earned credit (1 score point) on this sub-item, which required students to correctly identify all three of the statements that explained why the elements in Part A are necessary for the insects to survive. Ten other students correctly identified two of the three statements.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

Students reasoned from background knowledge, but not necessarily content area knowledge gained in school.

For example, one student selected option 1, and when asked how she knew, the student said, “if insects don’t have food or water they’ll die, and I know that just from background knowledge.” The student selected option 3 because, “plants need nutrients from the soil, or they will die too... I just used my background knowledge.” Student selected option 4 (*[g]ravel is necessary for water drainage*) and when asked how she knew, she said, “Just from learning it in school, I’ve just heard it before.”

**Item 2**

Item 2 of the Terrarium Matter Cycle cluster is shown in Figure 15.

*Figure 15. Item 2: Terrarium Matter Cycle*

**Part A**

Select the boxes to identify X, Y, and Z.

	X	Y	Z
Gravel	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Soil with Bacteria	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Water	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Insects	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Plants	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Part B**

Select the boxes to identify X, Y, and Z as a producer, consumer, or decomposer.

X:

Y:

Z:

**Part C**

Select the **two** numbers that represent arrows in the model to show when matter or energy is moved from the environment to organisms.

- ☐ 1
- ☐ 2
- ☐ 3
- ☐ 4
- ☐ 5

**Part D**

Carbon dioxide and water are missing from this model. If added, where would the arrow be pointing?

- Ⓐ from X toward Y
- Ⓑ from Y toward Z
- Ⓒ from the environment toward X
- Ⓓ from the environment toward Z

Students generally did not understand the *Terrarium Cycle of Matter and Energy* diagram in Item 2. One student did not answer any of the parts in Item 2.

## **Item 2 (Part A)**

### **SCORES**

Only three students earned full credit (3 score points) on Part A, which required selecting correct labels for X, Y, and Z. Ten other students earned 1 score point. Two of the three students who earned full credit were from Utah.

### **COMPREHENSION**

Six students said Part A was confusing. They appeared not to understand the conventions of the diagram and possibly also did not understand the concept of matter and energy cycle.

For example, one student said, “I don’t get this question . . . I think it’s missing something—the soil, the water, and insects that give it nutrients or something.” The student attempted to click the diagram, thinking it might be interactive. She then moved on to Part A, read it aloud, and said, “I think for number 1 it’s sun, then X is going to be *water*, and then this is going to be *insects*, and then this is going to be *plants*.” After checking X for *Water*, the student also checked X for *Insects* and X for *Plants*. She then realized that she had overwritten her response to X twice and went back to check X for *Water*, Y for *Insects*, and Z for *Plants*.

Only one of the Utah students thought this sub-item was confusing; the remaining five Utah students did not express confusion or appear to guess at the interpretation of the diagram.

## **Item 2 (Part B)**

### **SCORES**

Eight students earned credit (1 score point) in Part B by correctly identifying X, Y, and Z as a producer, consumer, or decomposer. Seven other students identified one of the components correctly.

### **COMPREHENSION**

Only one student expressed confusion on Part B, and this appeared to relate more to confusion over the producer, consumer, and decomposer roles than to the wording of the item. The student said:

“What was confusing on this was B, because I forgot which one was that, so I was looking, and I thought about what was a producer, and I remembered that [it] was something that helps it grow. And X was the soil and bacteria, so X would have been the producer. The consumer got me confused because I didn’t remember learning about the consumer. So, I was thinking it probably was the plants since I knew the decomposer was the one who would help the things decompose into the ground, and that was probably the insects. So, I knew that Y was the consumer.”

## REASONING

The reasoning of students who received credit for Part B indicated that they did know the facts of the matter and energy cycle, whether or not they understood the letters in the response choices as referencing the diagram.

For example, one student said, “X is a *producer*, Y is a *consumer*, and Z has to be *decomposer* . . . X is producer because sunlight goes to the plants, and then the plants produce food for themselves and others, Y is consumer because the consumer eats the producer, and Z is decomposer, because after the consumer dies, the decomposer decomposes it and turns it into soil.”

### **Item 2 (Part C)**

## SCORES

Only one (Utah) student earned credit (1 score point) on Part C, which required that students select both the arrows in the model that showed where matter or energy is moved from the environment to organisms. Nine other students correctly selected the arrow from the sun to X, but not the arrow from Z to X.

## COMPREHENSION

The vocabulary used in this sub-item, particularly “environment,” “organism,” and “matter,” was unfamiliar to several of the students.

For example, one student did not understand the term “matter.” The student said he was confused by “questions that had things to do with ‘matter’ because I know what matter is, but we started learning in science class, and I haven’t fully gotten the sense of matter yet.”

Confusion may also have arisen from the way in which the term “environment” is used, namely, to refer to the inanimate environment only.

## REASONING

Most students tried to reason their way to a solution, but their content knowledge was too limited to allow them to identify both correct arrows. For example:

One student said, “I’m going to say one of my answers is ‘1’ because of light energy maybe is being moved from the environment, from the sun – I’m pretty sure that’s part of the environment, and I’m pretty sure a plant is an organism. And for my second number I’m trying to think about what I can say . . . because the plant has matter, I’m pretty sure, or everything has matter. And a plant is an organism, and it says matter or energy, and the matter is being given or moved from the plant to the insect.”

Another student said, “I chose 2 and 3 since those are the necessary parts since the soil went in a circle to the soil. From the soil to the plants and from the plant to the insect. Since I thought that was the most important part. If it was 4 and 2, it would just be the same thing, but I thought 2 and 3 would be better and make more sense since the insect would be going to the soil and then the soil would make the plants and that wouldn’t really make sense.” The interviewer asks the student, “What do you think the question is asking?” The student

said, “It is showing that energy is moved from the environment to the organisms and I chose those since the matter in the sun is giving the soil energy to make the plants grow and that would keep going around. The plants would be decomposed or eaten by the bugs.”

**Item 2 (Part D)****SCORES**

Only three students earned credit (1 score point) on Part D, which asked where the arrow would be pointed if carbon dioxide and water were added to the model. Interestingly, eight students incorrectly indicated that the arrow would point from X toward Y.

**COMPREHENSION**

Several students simply lacked the content knowledge to answer this question.

For example, one student said, “because I had to find from X toward Y – I had to know that the insects carried the carbon dioxide to the plants, but then also carry it to the soil.”

**Item 3**

Item 3 of the Terrarium Matter Cycle cluster is shown in Figure 16.

*Figure 16. Item 3: Terrarium Matter Cycle*

Complete the table to identify your expected observations of the plants in a terrarium with only water, soil, and plants.

Day	Plants
1	<input type="text"/>
5	<input type="text"/>
10	<input type="text"/>
15	<input type="text"/>

**SCORES**

Seven students earned credit (1 score point) on this item.

**COMPREHENSION**

No issues with comprehension of the item were noted.

**REASONING**

Some students applied the information provided in the experiment to help them answer this question, although not all students were able to interpret the information from the experiment correctly.

An example of using the experimental information correctly was a student who said, “This question is asking me to see how the plants, what I would observe if the plants were in a terrarium with water, soil, and plants. Plants would be plants, and soil would be soil, and water would be something to keep the plants alive. So, day 1 they would probably be alive.

After 5 days, as long as plants are supplied by water and sun, they'd be alive. On day 10, they'd probably still be alive because of the ecosystem in the terrarium. On day 15, they could really be either, but I think that this question wants you to say, if they have everything they need, they'd be alive." After completing the cluster, when the interviewer asked the student if he used any information from the left side of the screen, the student said, "I used a lot of information from the left side of the screen because in terrarium 4 they stayed alive for 15 whole days, and just having soil, plants and water was not on that chart, but I bet they had it. I thought, since they stayed alive on that one, they'd stay alive in this one."

Another student used the data from the terrarium experiment but without seeming to comprehend how to interpret the data. He said, "What I found confusing was on [day] 5 that [the terraria] were tied, and that 2 of them were alive and 2 of them were not alive. So that made it really confusing since I didn't know which one to choose."

At least 10 students, however, including some of those who earned credit, used only their prior content knowledge and/or personal experience to respond.

For example, one student said, "Day 1: *alive*. I think I'll put *alive*. My plants have been alive for 2 weeks." She clicked *Alive* for days 1, 5, and 10. "*Alive*. I don't know if they're going to be alive so I'm going to try *Not Alive* (clicked *Not Alive* for day 15), I don't know. I've had tomatoes that lasted like months and months."

### 3.3 DETAILED DISCUSSION BY CLUSTER: MIDDLE SCHOOL

#### 3.3.1 Cluster 1: Galilean Moons

##### *Performance Summary*

The median time to complete the Galilean Moons cluster was 10 minutes. Table 21 and Table 22 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 21. Number of Students Attaining Cluster Total Scores in Specified Range: Galilean Moons*

Score 9–7	Score 6–4	Score 3–1	Score 0
5	4	3	0

*Note.* Maximum score = 9;  $n = 12$ .

*Table 22. Number of Students Attaining Item Scores in Specified Range, by Item: Galilean Moons*

Item 2	4	7	4	1

	Maximum Item Score	Score 1	Score 0
Item 3	1	3	9

*Note.*  $n = 12$ .

##### *Task Demands*

The following are task demands of the Galilean Moons cluster:

- Make simple calculations using given data to estimate the properties (e.g., mass, surface temperature, diameter) and locations of different solar system objects relative to a given reference point/object (Item 1).
- Calculate or estimate or identify properties of objects or relationships among objects in the solar system, based on data from one or more sources (Item 2).
- Given a partial model of objects in the solar system, identify objects or relationships that can be represented in the model or the reasons why they cannot be represented in the model (Item 3).

## Stimulus

The stimulus for the Galilean Moons cluster is shown in Figure 17.

Figure 17. Stimulus: Galilean Moons

Four of Jupiter's closest moons can be seen orbiting the planet by using a low-powered telescope. A ruler on the lens of the telescope is used to take measurements. The animation shows the movements of the moons and Jupiter over the course of several days. Click on the small gray arrow at the bottom left of the picture to begin the animation.

The table shows data on each of the moons.

	Diameter (km)	Mean Distance from Jupiter (km)	Orbital Period (days)
Callisto	4,800	2,000,000	16.7
Europa	3,318	700,000	3.5
Ganymede	5,262	1,000,000	7.2
Io	3,630	400,000	1.8

## Details by Item

### Item 1

Item 1 of the Galilean Moons cluster is shown in Figure 18.

Figure 18. Item 1: Galilean Moons

Use the measuring tool on the animation to determine each moon's maximum distance from Jupiter. Complete the table by entering the measurements to the closest 0.25 mark.

	Maximum Distance from Jupiter in Animation
<b>M1</b>	<input type="text"/>
<b>M2</b>	<input type="text"/>
<b>M3</b>	<input type="text"/>
<b>M4</b>	<input type="text"/>

## **SCORES**

This item was relatively easy for students; six students earned 4 score points (full credit), and one other student earned 3 score points. However, four students earned no credit (including one student who skipped over the item without attempting to answer it).

Eight of the 12 students seemed comfortable manipulating the simulation and re-watched, with appropriate pauses, to figure out each moon’s distances from Jupiter. Some also re-watched the simulation while responding to Item 2.

One student neglected to watch the simulation at all.

## **COMPREHENSION**

Although, the introduction to the stimulus states that “A ruler on the lens of the telescope is used to take measurements,” five students did not understand the measuring tool, or the units used on the tool.

One of these students used the mean distance from Jupiter in kilometers from the *Data on Galilean Moons* table for her responses to the item. The student said that the instructions suggested using a measuring tool, but she did not see a measuring tool.

Another student said, “I thought the numbers [going across the lens on the animation] were extremely confusing. I think that if they’re trying to take it to orbital days, then they have to make the length longer, but if it takes 16.7 days—well that’s orbit. I don’t know, it’s just super confusing. They should say that the numbers represent the length of time or the number of days.”

At least two students were confused by the instructions “to the closest 0.25 mark.”

## **REASONING**

The seven students who earned three or 4 score points all showed evidence in the think-aloud of using the animation in the manner intended to formulate their response.

For example, one student said that she was going to follow one moon at a time “because I can’t follow all of them at the same time.” As she watched the animation a second time, she noted where each of the moons was, narrating aloud, “M2 is around the 1.5 mark. M4 is around the 2.5 mark.” She then paused the video, studied the text of Item 1, and began entering the data. When she reached the response field for M3, she said, “I’ll just leave it at 7, because it went a little past 7 but not too far.”

**Item 2**

Item 2 of the Galilean Moons cluster is shown in Figure 19.

*Figure 19. Item 2: Galilean Moons*

Select the boxes to identify each moon by name.

	Callisto	Europa	Ganymede	Io
<b>M1</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>M2</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>M3</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>M4</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SCORES**

This item was also relatively easy for students; seven students received full credit (4 score points), and only one student received no credit.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

Nearly all the students reasoned their way to a solution using the stimulus materials as intended.

For example, one student stated she was going to look for the mean distance from Jupiter [on the *Data on Galilean Moons* table] and use what she got from the previous question—the maximum distance for each moon. The student selected M3 for Callisto “because it is the farthest away and has the largest mean distance.” She noted that Europa has the third “biggest” mean and, looking for the third largest maximum distance, deduced that M4 must be Europa. Seeing that Ganymede has the second largest mean distance, the student selected M1. The last moon left (Io) was identified by default as M2.

**Item 3**

Item 3 of the Galilean Moons cluster is shown in Figure 20.

*Figure 20. Item 3: Galilean Moons*

- Compare the measurements you took to the distances in the Data on Galilean Moons table. Then, select the statement that is true.
- Ⓐ The measurements you took are proportional to the data in the table.
  - Ⓑ The measurements you took are not proportional to the data in the table because the table is wrong.
  - Ⓒ There is not enough information to tell whether the measurements you took are proportional to the data in the table.
  - Ⓓ The data you measured is not proportional to the data in the table because your measurement instrument is imprecise at that distance.

**SCORES**

This item was much more challenging than the other items in the cluster, and only three students selected the correct response that the data the student measured are not proportional to the data in the table due to the differences in measurement accuracy.

The nine students who did not earn credit for this item were fairly evenly distributed across the distractors (four students chose C, three chose A, and two chose B), suggesting that they really were at a loss to understand how to explain the differences between their measurements and the data in the table.

**COMPREHENSION**

Two students said that they did not know the meaning of “proportional,” and, based on the item responses, it’s likely that a number of others did not fully understand the concept of proportional.

Although not mentioned, students may also not have understood what it meant that “your measurement instrument is imprecise.”

**REASONING**

Even students who selected the right answer, may not have done so with full comprehension.

For example, one student read through all the answers, then started eliminating answers. First, she eliminated A and B, then decided the answer was D because the ruler measured the distance in the animation, but the table gave the distances in kilometers.

### 3.3.2 Cluster 3: Hippos

#### *Performance Summary*

The median time to complete the Hippos cluster was 10 minutes. Table 23 and Table 24 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 23. Number of Students Attaining Cluster Total Scores in Specified Range:  
Hippos*

Score 10–7	Score 6–4	Score 3–1	Score 0
2	5	3	0

*Note.* Maximum score = 10;  $n = 10$ ; two students ran out of time before completing this cluster.

*Table 24. Number of Students Attaining Item Scores in the Specified Range, by Item:  
Hippos*

	Maximum Item Score	Score 4–3	Score 2–1	Score 0
Item 1	4	1	9	0

Item 2	1	5	5
Item 3	1	7	3
Item 4	1	3	7

*Note.*  $n = 10$ ; two students ran out of time before completing this cluster.

#### *Task Demands*

The following are task demands of the Hippos cluster:

- Articulate, describe, illustrate, or select the relationships or interactions to be explained. This may entail sorting relevant from irrelevant information or features (Item 1).
- Express or complete a causal chain common or distinct across organisms or environments. This may include indicating directions of causality in an incomplete model such as a flow chart or diagram or completing cause and effect chains (Item 2).
- Express or complete a causal chain common or distinct across organisms or environments. This may include indicating directions of causality in an incomplete model such as a flow chart or diagram or completing cause and effect chains (Item 3).

- Articulate, describe, illustrate, or select the relationships or interactions to be explained. This may entail sorting relevant from irrelevant information or features (Item 4).
- Use an explanation to predict interactions among different organisms or in different environments (Item 5).

### ***Stimulus***

The stimulus for the Hippos cluster is shown in Figure 21.

***Figure 21. Stimulus: Hippos***

In Africa, a variety of organisms coexist with others in distinct ecosystems. For example, hippopotamuses spend time in both aquatic and savannah ecosystems.

When found in aquatic environments, hippopotamuses are often surrounded by carp.

When found in a savannah environment, hippopotamuses are often surrounded by birds called oxpeckers.

## COMPREHENSION

As evidenced from their reasoning in the think-alouds, students understood that they were to choose questions they thought would be helpful to explain the relationships between hippos and oxpeckers or carp, although, as can be seen from the score distribution, they did not necessarily know what those questions would be. Two students, however, commented on the fact that being asked to choose questions seemed like a waste of time in light of the fact that answers eventually were populated for all the questions.

Three students did not initially understand that they had to click “Ask Question” and could only ask one question at a time; one student initially thought that she had to type the text of the question rather than select from the list.

### Item 2

Item 2 of the Hippos cluster is shown in Figure 23.

*Figure 23. Item 2: Hippos*

Use the information from the previous question to describe the likely reason that carp surround hippopotamuses in the water.

Click on each blank box and select the words that complete the statement.

In an aquatic environment, carp depend on  to provide .

## SCORES

Half of the students (five) received credit for this item.

## COMPREHENSION

Students found this item easy to comprehend, and they had sufficient knowledge of transactional relationships among animals to understand the concept behind the item.

Score variance on this item (and the next) came from the “to provide” response; students found it obvious that the response for the first drop-down box should be Hippopotamuses.

## REASONING

Most students reasoned appropriately from the information in Item 1 to determine their response.

For example, one student said, “In an aquatic environment, carp depend on . . . so why would a carp depend on the hippopotamus? [Referring back to question 1:] So what preys on hippos? I don’t need that. Where do they spend their time? I don’t need that. Where do oxpeckers spend most of their time? On the bodies of host mammals. What do hippos consume? Grass and plants. Where do oxpeckers roost? On the bodies of host mammals. Oh, so I believe that in the aquatic environment, carp depend on hippos to provide . . . food . . . Because they eat fleas, dead skin, parasites, and mucous.”

Those who did not respond correctly simply made wrong inferences from the data—some of which were wrong but plausible.

For example, one student explained why he selected protection by saying, “hippopotamuses are a much bigger animal than the fish and could provide protection from the crocodile.” The student noted that, in Item 1, one of the answers indicated that crocodiles, snakes and larger fish prey on carp.

### **Item 3**

Item 3 of the Hippos cluster is shown in Figure 24.

*Figure 24. Item 3: Hippos*

Use the information from the previous question to describe the **most likely** reason that oxpeckers surround hippopotamuses on the land.

Click on each blank box and select the words that complete the statement.

In the savannah environment, oxpeckers depend on  to provide .

### **SCORES**

Seven students received credit for this item.

### **COMPREHENSION**

This item is very similar to Item 2, and the same observations about comprehension apply.

### **REASONING**

This item is very similar to Item 2, and the same observations about reasoning apply.

### **Item 4**

Item 4 of the Hippos cluster is shown in Figure 25.

*Figure 25. Item 4: Hippos*

Select the boxes to identify which organisms are paired with the hippopotamus in the described relationships.

	<b>Oxpecker</b>	<b>Carp</b>	<b>Neither</b>
<b>Predatory relationship</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Competitive relationship</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>Mutually beneficial relationship</b>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SCORES**

Three students earned credit on this item, which required that all three answers about organisms in relationships with hippos be correct. The fewest students (two) correctly identified the answer for *Competitive relationship*.

**COMPREHENSION**

Although students generally understood the concept of transactional relationship among animals, some lacked prior knowledge of the terms used in the item.

For example, one student said that “mutually beneficial” was the only relationship mentioned in the sample lesson. He did not know if the predatory and competitive relationships were “interchangeable or how it worked.”

**Item 5**

Item 5 of the Hippos cluster is shown in Figure 26.

*Figure 26. Item 5: Hippos*

Given this information, what is a reasonable hypothesis about why carp and oxpeckers cluster around hippopotamuses, why the hippopotamus allows this behavior, and why these patterns of behavior are similar.

Type your answer in the space provided.

**SCORES**

One student earned full credit (3 score points) by providing correct hypotheses for each of the three questions posed in the item stem.

Four other students provided a correct hypothesis for at least one of the questions.

**COMPREHENSION**

There were no comprehension issues with this item.

**REASONING**

Some students failed to address the task of formulating hypotheses altogether. Others made appropriate use of the information gathered from the previous items in formulating their responses, but, given that their understanding of the previous items was not necessarily correct, these misunderstandings could carry over into this item.

### 3.3.3 Cluster 3: Morning Fog

#### *Performance Summary*

The median time to complete the Morning Fog cluster was 12 minutes. Table 25 and Table 26 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 25. Number of Students Attaining Cluster Total Scores in Specified Range: Morning Fog*

Score 9–7	Score 6–4	Score 3–1	Score 0
2	3	7	0

Note. Maximum score = 9;  $n = 12$ .

*Table 26. Number of Students Attaining Item Scores in Specified Range, by Item: Morning Fog*

	Maximum Item Score	Score 7–6	Score 5–3	Score 2–1	Score 0
Item 1 (Parts A–C)	7	0	10	2	0

	Maximum Item Score	Score 2	Score 1	Score 0
Item 1 (Part D)	2	3	0	9

Note.  $n = 12$ .

#### *Task Demands*

The following are task demands of the Morning Fog cluster:

- Select or identify from a collection of potential model components including distractors, the components needed to model the model of evaporation, condensation, transpiration, precipitation, or other behaviors of water molecules during the water cycle.
- Assemble or complete, from a collection of potential model components, an illustration or flow chart that represents the phenomenon. This does not include labeling an existing diagram.
- Given models or diagrams of the phenomenon, identify the parts of the model and how they change in each scenario OR identify the properties of the model that cause the change.

## Stimulus

The stimulus for the Morning Fog cluster is shown in Figure 27.

Figure 27. Stimulus: Morning Fog

## Details by Item

### Item 1

Item 1 of the Morning Fog cluster is shown in Figure 28.

*Figure 28. Item 1: Morning Fog*

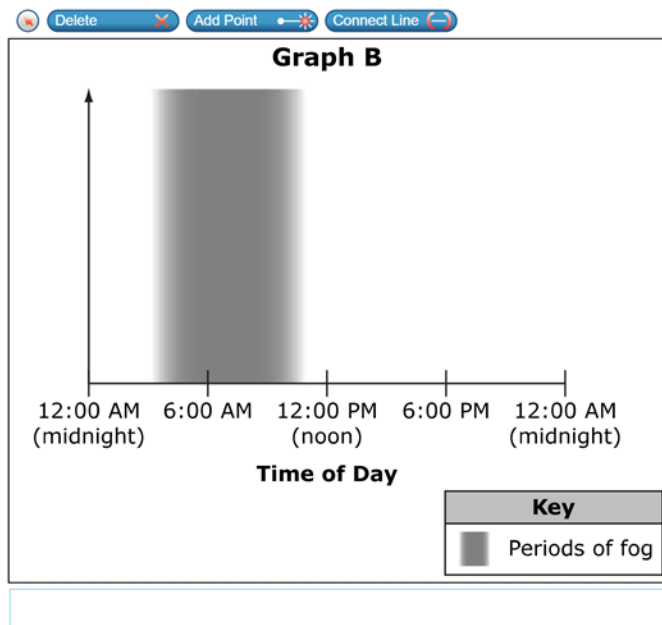

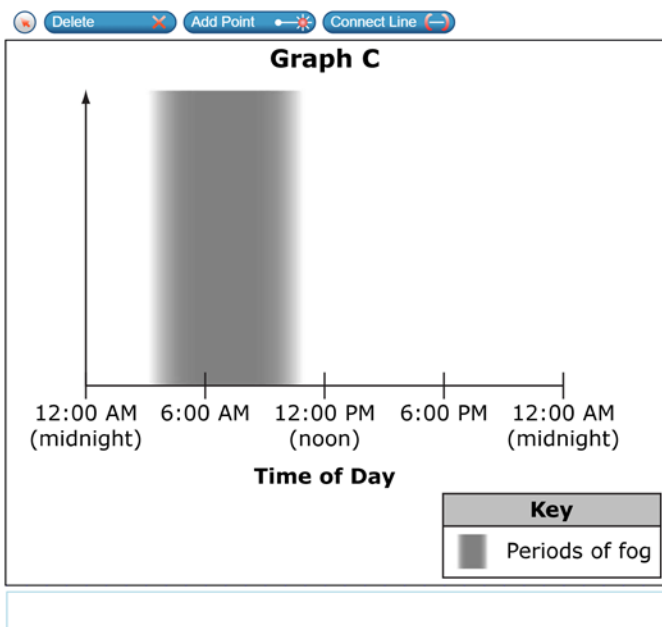

In the three blank graphs below, draw three line graphs illustrating three different factors that change over the course of the day to cause the fog to appear and disappear. The horizontal axis on each graph represents the 24-hour day shown in the animation.

For each graph, select the explanatory factor that you would like to graph on the vertical axis. Then, use the Connect Line tool to draw a line graph showing the pattern of change over time for the selected factor. Your line segments must be connected and form a continuous graph to receive credit.

#### Part A

Graph A Vertical Axis Explanatory Factor:

**Part B**Graph B Vertical Axis Explanatory Factor: **Part C**Graph C Vertical Axis Explanatory Factor: **Part D**

The process described in  causes the process described in , which causes the process described in .

## **Item 1 (Parts A–C)**

### **SCORES**

Parts A–C were scored as a unit.

Students could earn up to 6 points for correctly drawing three-line graphs showing how weather factors affecting fog formation changed over the course of the day; they could earn up to 3 points for correctly identifying the explanatory factor associated with each of the processes they chose to graph.

Half of the students (six) earned some credit for their graphs, but none earned full credit.

- Six earned points for graphing a decrease in the evening in one or more of the following: sunlight intensity, temperature, and/or proportion of water in the air
- Six earned points for graphing sunlight intensity, showing both an increase in the morning and a decrease in the evening.

No one earned points for graphing either the proportion of water in the air declining as the fog forms and increasing as the fog dissipates, or the temperature decreasing when the fog begins to form and rising when the fog dissipates.

Four students did not earn any credits for their graphs, and their graphs did not resemble the correct answers: they included horizontal lines, a single line that ascended, and dots with no connecting line.

All but two of the students earned at least two out of the three possible score points for the explanatory factors. The numbers of students earning points for correctly identifying each explanatory factor were as follows:

- Sunlight intensity (nine students)
- Air temperature (eight students)
- Proportion of water in the air in gas form (nine students)

### **COMPREHENSION**

Eight students were confused about how to draw the line graphs, including four who did not understand that they had to define the value of the y-axis. The following are examples of think-alouds from students who were confused by the graphs:

- “I have no idea. I don’t understand this graph. It’s confusing. Since there’s nothing on the left, the vertical. (referring to the y-axis). The three factors that can change, I have no idea what they mean by that. I feel like they’re not giving enough information for me to understand. I’m so confused. The three different factors are what—the nighttime? What’s the difference between the graphs? Wouldn’t they all be the same? Oh, three different factors.” (The student apparently didn’t see the explanatory factor drop-down menu until this point.)

- The student re-read the part of the question that discusses “showing the pattern of change over time for the selected factor” and commented, “yeah, that really doesn’t make sense, how they want me to connect the line. If I saw this on a test, I would just freak out because I wouldn’t know how I was supposed to draw a line graph to represent this.”
- “How do you represent how much fog? I’m guessing”—the student clicked to create some points—“I’m guessing it’d be something like that.” The student clicked around some more and then connected the points. “I guess that’s what I’m gonna say, because this really doesn’t make sense how they want you to draw a graph. If anything, they should have increments and a chart of how high the fog rises or how much of whatever is in the air.”

Six students were initially unclear about how to use the pull-down menu of explanatory factors, but mostly figured out how to use them.

Two students had a somewhat better understanding of Parts A–C after they read Part D and went back and changed some of their answers in Parts A–C.

For example, after reading Part D, one student realized that each graph was meant to represent a different factor. When asked, the student said that he misunderstood the question and picked the same factor for all three graphs at first because he didn’t know what was meant by the term “explanatory factor,” and thought the question was just asking about the fog.

## **REASONING**

Half of the students (six) re-watched the animation while drawing the line graphs.

An example of correct reasoning from the animation comes from the student who earned the most score points on parts A–C (7 points). She indicated that she chose Proportion of Water in the Air for her first graph because it was “the one that related to the fog the most.” When asked to explain more about her graph, the student said she looked at the animation “to see the intensity of the fog and when it decreased” and that’s why she made the graph increasing then decreasing. “First increasing from 3 to 6 [A.M.], then decreasing from 6 to 8.”

### **Item 1 (Part D)**

## **SCORES**

Only three students earned the two possible core points by correctly responding that variations in sunlight intensity affect air temperature, which, in turn, affects the proportion of water in the air in gas form (water cycle).

## **COMPREHENSION**

Since most students were confused by Parts A–C, they also had trouble understanding what they were being asking to do in Part D.

### 3.3.4 Cluster 4: Texas Weather

#### *Performance Summary*

The median time to complete the Texas Weather cluster was 14 minutes. Table 27 and Table 28 indicate the number of students attaining cluster total scores and items scores within the specified ranges, respectively.

*Table 27. Number of Students Attaining Cluster Total Scores in Specified Range: Texas Weather*

Score 11–7	Score 6–4	Score 3–1	Score 0
0	4	8	0

Item 3	1	6	3

*Note.*  $n = 12$  for Item 1, Parts A and B; 11 for Item 2, and 10 for Item 3. One student did not scroll down to Items 2 and 3, and one student gave up and refused to attempt Item 3.

#### *Task Demands*

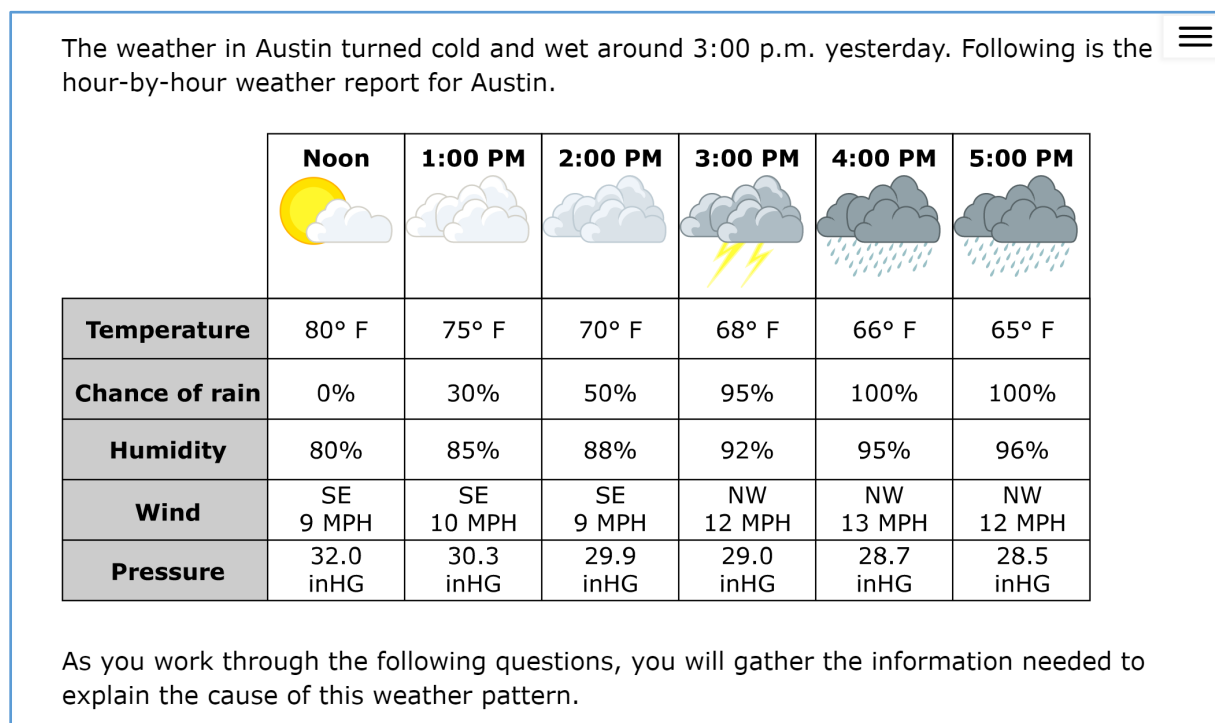

The following are task demands of the Texas Weather cluster:

- Describe, illustrate, or select tools, locations, and/or methods to use in investigations of phenomena related to interactions of air masses. This should show how or where measurements will be taken (Item 1).
- Identify, select, or describe the relevance of particular data or sources relevant to the process of weather forecasting (Item 1).
- Predict the effects of given changes in the air masses' interactions on subsequent weather (Item 2).
- Predict the effects of given changes in the air masses' interactions on subsequent weather (Item 3).

**Stimulus**

The stimulus for the Texas Weather cluster is shown in Figure 29.

**Figure 29. Stimulus: Texas Weather**

## Details by Item

### Item 1

Item 1 of the Texas Weather cluster is shown in Figure 30.

Figure 30. Item 1: Texas Weather

#### Part A

The following question has two parts. First, answer part A. Then, answer part B.

Use the simulator to take measurements that will help you determine what caused Austin's afternoon weather.

You will be scored on your selections, so be sure to:

- specify what you are looking for,
- use the appropriate tools to look for them,
- keep taking measurements until you know what caused the weather, and
- stop taking measurements when you have all the information you need.

You may take a maximum of 8 measurements.

Checking for a(n) Air Mass

Location 1

Time of day 3pm

Tool 1 Thermometer

Tool 2 Barometer

Take Measurement

Measurement Number	Location	Checking For	Time of Day	Temperature	Wind Speed	Wind Direction	Pressure

#### Part B

From the measurements that you have taken, indicate up to two measurements (by "Measurement Number" from the result table in the simulation) that provide sufficient evidence for the claim in the first column. Be sure to select "None" if the measurements do not provide sufficient evidence of a claim.

## **Item 1 (Part A)**

### **SCORES**

Part A was extremely difficult for students, and the randomness of earned points across students suggests that none of the students really understood what they were supposed to do with the simulator, either because they didn't have the requisite content knowledge or they were confused by the manner in which the simulator was presented.

Four of the points in the scoring rubric for Part A involve the parameters that the student chooses for trials on the simulator or matching the right tools with the right parameters, but many students failed to change the parameter on successive trials and simply focused on manipulating the tools. Four students used air mass (the default) for all of their measurements, and two students used primarily air mass. Consequently, score points based on choice of parameter or match between parameter and tools may not be meaningful. That said,

- nine students earned 1 score point for selecting air mass as the parameter on at least one trial;
- no students earned a score point for matching the correct tools with air mass;
- no students earned a score point for selecting movement as the parameter; and
- two students earned a score point for matching the correct tools with movement on at least one trial.

The four remaining points for Part A were awarded for measuring the correct factor at the proper locations and/or time and for doing so using the correct tools.

- Three students earned a point for at least one trial checking for movement measured at locations 3, 4, or 5.
- A different student earned a point for at least one trial checking for air mass measured at 1 p.m. at locations 3, 4, or 5.

The criterion statements in this section of the rubric were inconsistent. The criterion on which three students earned a point was the most permissive in that it specified a location, but not a time.

### **COMPREHENSION**

Seven students did not initially understand what actions they were supposed to take to run trials on the simulator. Seven other students were unfamiliar with some of the measuring tools and did not know what they measured. Another student took only one measurement because he did not understand how to take more measurements.

The instructions to “determine what caused Austin’s afternoon weather” were too open ended for these students.

- At least three students noted that the answer choices in Part B would have given them an idea of how to tackle the problem if they had read Part B before working with the simulator.

- Two students earned the most credits on Part A (4 score points) by (1) checking for air mass and movement, (2) choosing wind vane and anemometer when checking for movement, and (3) conducting one trial for air mass measured at 1 p.m. at locations 3, 4, and 5. One of these students said she was confused and overwhelmed when probed about this item.
  - “There was no way I could read this and understand it, I’ll just look back and forth between [the chart and the table].” The student explained, “I’ve never been good with weather – it doesn’t make sense to me how everything works . . . I didn’t understand the table – like how it correlated with what I was putting in [Part A]. I was overwhelmed with eight measurements because it said, ‘Do Part A and then Part B,’ so I was thinking okay, I should do Part A and then Part B. But then after I did Part B, I realized that I should have looked at Part B first so I would know what eight measurements to take! I didn’t know the difference in what would show up on the table if I chose air mass, or movement, or precipitation. I just didn’t understand what difference it would make in each choice I had.”

## REASONING

The other student who earned 4 score points on the item had a somewhat better understanding of how to use the simulator to find out what caused Austin’s afternoon weather.

In her think-aloud, the student said that she was going to take measurements first at Location 3 because it’s most central. She chose 3 p.m. because that’s when the weather turned cold and wet in Austin. She then changed the measurement to Location 4 because “it’s closest to Austin and what the chart pertains to.” Said she would leave the time as 3 p.m. as that’s when it was cold and wet. She said she would use the anemometer and the thermometer. She clicked *Take Measurement*. She said she would check for precipitation but didn’t see any tools that pertained. She then chose movement at Location 3, using a wind vane and an anemometer, to see if the wind was going in that direction.

## Item 1 (Part B)

### SCORES

Only one student got credit for Part B, and this may have been by chance, given that the student only earned one of the eight possible points on Part A.

### COMPREHENSION

At least three students did not realize that the numbers 1 through 8 on Part B were the eight measurements they were allowed to take in Part A, and that they were to pick measurements that showed evidence for the claim in column 1.

### REASONING

Given their performance on Part A, students had little to work with in Part B, even if they understood what they were supposed to do.

For example, one student said that she had to make her best guess in Part B because “none of my measurements in Part A told me anything because I took all the wrong measurements in Part A. Part B was truly kind of stressful for me.”

## **Item 2**

Item 2 of the Texas Weather cluster is shown in Figure 31.

*Figure 31. Item 2: Texas Weather*

Suppose that it was hot and humid in San Antonio at 3:00 p.m. What does the pattern of weather suggest for precipitation in San Antonio in the evening?

- (A) The pattern is not likely to affect precipitation in San Antonio in the evening.
- (B) The pattern suggests that the chance of rain in San Antonio will stay about the same as it was at 3:00 p.m.
- (C) The pattern suggests that the chance of rain will increase.
- (D) The pattern suggests that the chance of rain will decrease.

## **SCORES**

Four of the 10 students who attempted this item earned credit.

## **COMPREHENSION**

Given performance on Item 1, it is unlikely that these students’ scores actually reflected mastery of the content being assessed by the item.

Some students understood “pattern of weather” as referring to the hour-by-hour weather report shown in the stimulus, and it’s not clear that any of the students realized that the question pertained to a different location than the weather report (or Item 1).

For example, one student referred to the weather report table and said that the table indicates that the chance of rain will likely increase so he couldn’t select decrease (pointing at both option A and option D). The student noted that option B suggests no change, but the table shows a very clear change in the chance of rain, therefore B could not be the answer. The student referred to the table again and said that the chance of rain was increasing, so C was the only possible answer that works.

### **Item 3**

Item 3 of the Texas Weather cluster is shown in Figure 32.

*Figure 32. Item 3: Texas Weather*

Suppose that it was hot and humid in San Antonio at 3:00 p.m. What does the pattern of weather suggest for the temperature in San Antonio in the evening?

- Ⓐ The pattern is not likely to affect temperature in San Antonio in the evening.
- Ⓑ The pattern suggests that temperature in San Antonio will stay about the same as it was at 3:00 p.m.
- Ⓒ The pattern suggests that the temperature will increase.
- Ⓓ The pattern suggests that the temperature will decrease.

### **SCORES**

Six of the nine students who attempted this item earned credit.

### **COMPREHENSION**

As with the other items in this cluster, students had, at best, a faulty understanding of this item. Consequently, as with Item 2, a correct response did not indicate mastery of the content being assessed.

For example, one student said that, as soon as she read “temperature,” she went to the weather report table, looked at the temperature at 3 p.m., and saw that the temperature was decreasing over time. The student then went back to the question and read through the options and noted that answer A was about no effect, that B was about staying the same, and C was about the temperature increasing. Since the temperature is decreasing, the student decided that answer D was the only one that matched the data.

### 3.4 DETAILED DISCUSSION BY CLUSTER: HIGH SCHOOL

#### 3.4.1 Cluster 1: Blood Sugar Regulation

##### *Performance Summary*

The median time to complete the Blood Sugar Regulation cluster was 19 minutes. Table 29 and Table 30 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 29. Number of Students Attaining Cluster Total Scores in Specified Range: Blood Sugar Regulation*

Score 7–6	Score 5–3	Score 2–1	Score 0
0	9	3	1

*Note.* Maximum score = 7;  $n = 13$ ; two students ran out of time before completing this cluster.

*Table 30. Number of Students Attaining Item Scores in Specified Range, by Item: Blood Sugar Regulation*

	Maximum Item Score	Score 3	Score 2–1	Score 0
Item 1	3	8	4	1
Item 2	3	0	3	11

	Maximum Item Score	Score 2	Score 1	Score 0
Item 3	2	3	7	3

*Note.*  $n = 13$ ; two students ran out of time before completing this cluster.

##### *Task Demands*

The following are task demands of the Blood Sugar Regulation cluster:

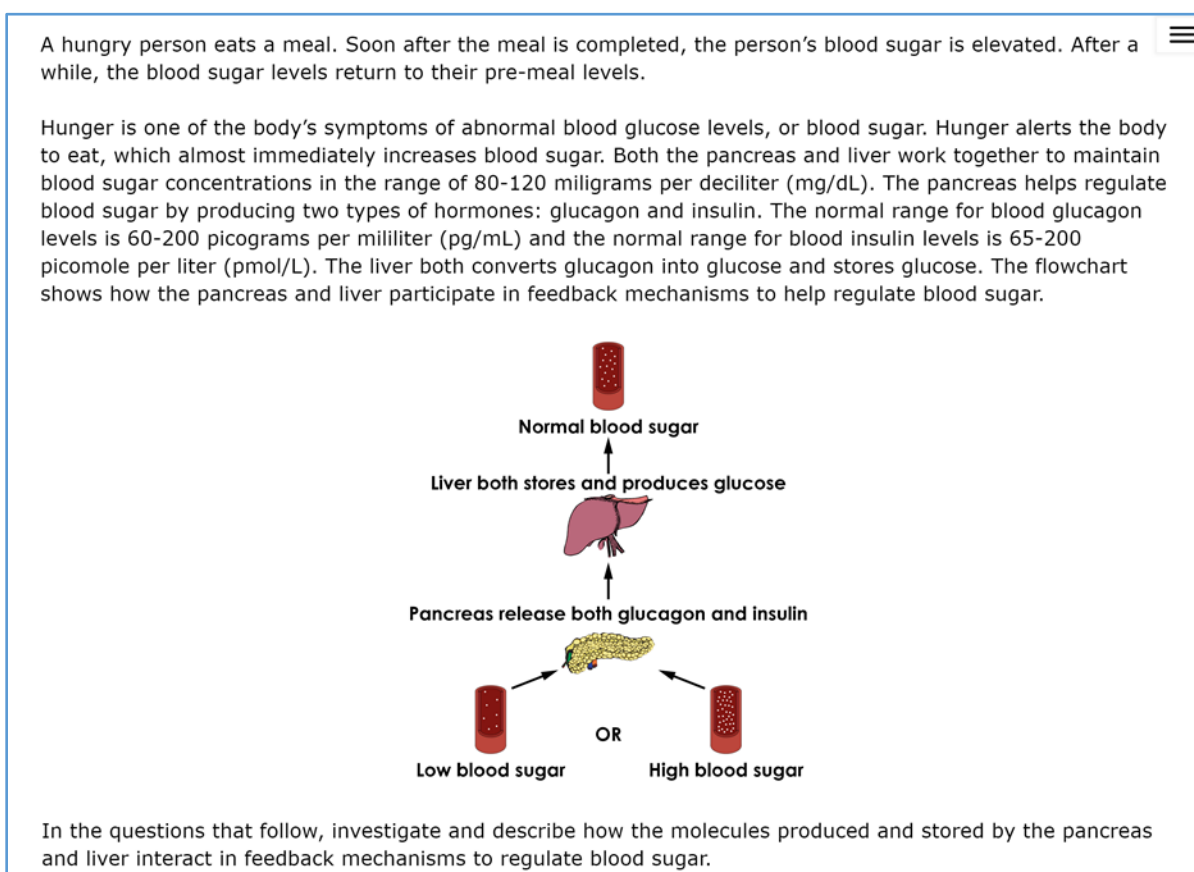

- Identify the outcome data that should be collected in an investigation to provide evidence that feedback mechanisms maintain homeostasis. This could include measurements and/or identifications of changes in the external environment, the response of the living system, stabilization/destabilization of the system's internal conditions, and/or the amount of systems for which data is collected.
- Make and/or record observations about the external factors affecting systems interacting to maintain homeostasis, responses of living systems to external conditions, and/or stabilization/destabilization of the system's internal conditions.

- Identify or describe the relationships, interactions, and/or processes that contribute to and/or participate in the feedback mechanisms maintaining homeostasis that lead to the observed data.
- Using the collected data, express or complete a causal chain explaining how the components of (a) mechanism(s) interact in response to a disturbance in equilibrium in order to maintain homeostasis. This may include indicating directions of causality in an incomplete model such as a flow chart or diagram or completing cause and effect chains.
- Evaluate the sufficiency and limitations of data collected to explain the cause and effect mechanism(s) maintaining homeostasis.

### Stimulus

The stimulus for the Blood Sugar Regulation cluster is shown in Figure 33.

**Figure 33. Stimulus: Blood Sugar Regulation**

## Details by Item

### Item 1

Item 1 of the Blood Sugar Regulation cluster is shown in Figure 34.

**Figure 34. Item 1: Blood Sugar Regulation**

Use the simulation to generate data to construct and support your description of how the pancreas and liver interact in feedback mechanisms to regulate blood sugar.

Click on the drop-down menu to select a Time Period for which to generate concentrations of blood molecules. Next, select a Molecule Concentration of the type of blood to measure. Then click Start to view the data.

- Make sure your table contains only the data you want to submit.
- If you need to change your selections, click the trash can icon next to a row to delete the data from the row.

Time Period	Molecule Concentration	4 am	6 am	8 am (Meal)	10 am	12 pm (Meal)	2 pm	4 pm
4 am								

Molecule Concentration

Glucose (mg/dL)

Start

## SCORES

Student scores on this item are as follows:

- Eight students earned 3 score points (full credit).
- Three students earned 2 score points.
- Two students earned 1 score point.

## COMPREHENSION

Seven students expressed some confusion in figuring out how to generate data in the simulation. For example, one student was confused by the layout of the item and by the term “simulation” because she was not sure whether she should test all the options or provide her own answer. At this point she skipped ahead to look at the next items to see if they would provide any clues as to how she should proceed on Item 1 but did not find that helpful. She was very unsure what to do next and seemed overwhelmed by the options. After some flipping back and forth, she decided to measure all three values for each of the times offered.

At least three students went back to Item 1 and re-generated the data in the simulation once they knew that they had to create three graphs in Item 2.

**REASONING**

Students used the simulations as a learning experience. For example, when asked how he decided how many simulations to do, one student said, “Well, I knew that there was three different substances (glucose, glucagon, and insulin). I wasn’t really sure how it worked, and then once I did it, I was like ‘OK well that’s when you have a meal,’ so I knew from the reading that’s when your blood sugar spikes.”

**Item 2**

Item 2 of the Blood Sugar Regulation cluster is shown in Figure 35.

*Figure 35. Item 2: Blood Sugar Regulation*

Construct three graphs describing three different relationships in the simulation data.

A. Click on each blank box and select a label for both the x and y axes on each graph.

B. Then, use the Add Arrow button to draw one line on each graph to show the relationship between the variables labeled on the axes.

**Relationship 1:**

x-axis:  y-axis:

**Relationship 2:**x-axis:  y-axis:  Delete  Add Point  Add Arrow**Relationship 3:**x-axis  y-axis  Delete  Add Point  Add Arrow

## SCORES

Student scores on this item are as follows:

- No students earned 3 score points (full credit).
- Two students earned 2 score points.
- One student earned 1 score point.

## COMPREHENSION

Eight students expressed some confusion as to how to construct the graphs of the simulation data. For example, one student was “kind of confused” about where to draw the second and third graphs. Initially she did not see the answer grids for the second and third graphs, but even after she noticed the additional answer grids, some confusion lingered.

At least five students were not sure how to represent the units or values on the graphs, and two students did not draw any graphs for that reason. For example, for the first relationship, one student chose glucose versus time for the first relationship, but he was not sure which value to put on which axis: “I’ve never looked at the concentration of molecules and tried to graph it, and I feel like there are a lot of things I’m missing to help me figure out what to do. I think I may be overcomplicating it to myself.”

## REASONING

The following is an example of how one student reasoned through the construction of one of the graphs.

The student said that he was going to place concentration on the x-axis and time on the y-axis because “in sciences you usually do time on the y-axis and concentration and stuff on the x-axis. I don’t know why, it’s what I’ve always known.” He selected *Glucose Concentration* for the x-axis and *Time Passed after Eating* for the y-axis. He used the numbers for the glucose concentrations from the simulation in Item 1 to plot points on the graph. He said, “I feel like it spikes up like 5 times so I’ll put it a decent amount, 6, 8 and then 10, and it kind of stays pretty high but not as high, so like right there, and then it drops a little bit again, and then it spikes up in a big lunge, and then it drops back down again to here, but it kind of stayed, and then it spiked the highest peak at dinner.” He then started to connect the points, and said, “I don’t know what the point of the arrows are, I’m just going to connect them all to show their relationship. That’s my best guess to show what happened each hour.”

**Item 3**

Item 3 of the Blood Sugar Regulation cluster is shown in Figure 36.

*Figure 36. Item 3: Blood Sugar Regulation*

Click on each blank box and select the words or phrases to complete the statements describing the feedback mechanisms that regulate blood sugar levels.

Hunger is part of the  feedback mechanisms, in which the liver and pancreas participate, that  a change in the blood's glucose concentration. The pancreas produces  when blood glucose . The liver responds by  glucose.

**SCORES**

Student scores on this item are as follows:

- Three students earned 2 score points (full credit).
- Seven students earned 1 score point.
- Among these 10 students,
  - four earned a point for correctly filling the blanks in the statement about hunger; and
  - seven earned a point for correctly filling the blanks in the statement about the roles of the pancreas and the liver.

**COMPREHENSION**

No students expressed confusion about this item.

**REASONING**

In responding to Item 3, five students referred to the stimulus, and two students referred to the simulation results in Item 1.

### 3.4.2 Cluster 2: Saving the Tuna

#### *Performance Summary*

The median time to complete the Saving the Tuna cluster was 14 minutes. Table 31 and Table 32 indicate the number of students attaining cluster total scores and items scores within the specified ranges, respectively.

*Table 31. Number of Students Attaining Cluster Total Scores in Specified Range: Saving The Tuna*

Score 7–6	Score 5–3	Score 2–1	Score 0

	Maximum Item Score	Score 2	Score 1	Score 0
Item 2 (Part A and B)	2	3	0	9

*Note.*  $n = 12$ ; three students ran out of time before completing this cluster.

#### *Task Demands*

The following are task demands of the Saving the Tuna cluster:

- Articulate, describe, illustrate, or select the relationships, interactions, and/or processes to be explained. This may entail sorting relevant from irrelevant information or features.
- Express or complete a causal chain explaining how human activity impacts the environment. This may include indicating directions of causality in an incomplete model such as a flow chart or diagram or completing cause and effect chains.
- Identify evidence supporting the inference of causation that is expressed in a causal chain.

- Use an explanation to predict the environmental outcome given a change in the design of human technology.
- Describe, identify, and/or select information needed to support an explanation.

## Stimulus

The stimulus for the Saving the Tuna cluster is shown in Figure 37.

Figure 37. Stimulus: Saving the Tuna

**Saving the Tuna**

North Atlantic bluefin tuna are one of the most prized fish in danger of overfishing. One 342 kilogram (kg) tuna sold for close to \$400,000 dollars at a fish market in Tokyo.

Bluefin tuna are the apex predators in their ecosystem. They hunt, travel, and live within schools, or large groups, of other bluefin tuna individuals. Bluefins start out as extremely tiny larvae, no more than a few millimeters long, and weigh only a few hundredths of a gram. Within three to five years, sexually mature adults can reach lengths of three feet (about one meter) and can weigh over 600 kg. As adults, they can dive as deep as 914 meters and can swim very long distances in the open ocean during migration season. Their migration season spans from approximately May to June, during which they spawn near the Gulf of Mexico.

Because bluefin are prized fish that vary greatly in size and can be found in schools, or groups, within a wide range of water depths, netting fishing methods are commonly used to target and catch these individuals. However, fishing nets often catch bycatch individuals, or non-tuna individuals. The table summarizes several netting fishing methods and the relative amounts of targeted tuna and bycatch individuals caught at one time by each method.

**Summary of Netting Fishing Methods**

Method	Description	Type of Targetted Catch	Total Number of Individuals Caught at a Time	Percent of Total Catch that is Bycatch (%)	Types of Bycatch Caught
Purse Seining	Large wall of netting that herds fish together and then envelops them when the net is pulled by a drawstring	Schooling or spawning fish	Hundreds to thousands	35 - 70	Sea turtles, dolphins, and other fish
Cast Netting	Small-meshed netting cast from shore or canoes that expands a relatively small area	Groups of small fish	Up to a hundred	10 - 30	Other small fish
Gillnetting	Large curtains of netting suspended by a system of floats and weights that can either be anchored to the seafloor or allowed to float at the surface	All types of fish	Hundreds to thousands	40 - 75	Sea birds, sea turtles, octopi, shark, dolphins, other fish, and crustacea
Midwater Trawling	Gigantic nets that span the size of five football fields pulled by large industrial ships through the open ocean, catching entire schools of fish	All types of open-ocean fish	Thousands to tens of thousands	30 - 75	Sea turtles, shark, dolphins, and other fish
Seine Netting	Small-meshed netting suspended vertically by floats and weights from the surface of intertidal water to enclose and concentrate fish	Crustacea and shell fish	Less than a hundred	10 - 30	Sea birds and other small fish

Your task is to design, evaluate, and refine solutions for reducing the impacts of human fishing on the population of tuna and other native species in the Northern Atlantic Ocean.

## Details by Item

### Item 1

Item 1 of the Saving the Tuna cluster is shown in Figure 38.

Figure 38. Item 1: Saving the Tuna

The following question has three parts. First, answer part A. Next, answer part B. Then, answer part C.

### Part A

Select the boxes to evaluate the tradeoff considerations of each fishing method.

- You may select more than one method per column.

	Likely to Catch the Greatest Number of Tuna Individuals	Likely to Catch the Least Number of Tuna Individuals	Likely to be the Best at Targeting Tuna Individuals	Likely to be the Worst at Targeting Tuna Individuals	Likely to be the Best at Protecting Biodiversity of Ecosystem	Likely to be the Worst at Protecting Biodiversity of Ecosystem
Purse seining	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Cast netting	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Gilnetting	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Midwater trawling	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Seine netting	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Part B

Based on the evaluation of tradeoff considerations in part A, which fishing method best limits the negative effects of human fishing on non-tuna populations in the Northern Atlantic?

- (A) purse seining
- (B) cast netting
- (C) gilnetting
- (D) midwater trawling
- (E) seine netting

### Part C

Click on each blank box and select a word or phrase to complete a statement describing a change that can be made to decrease the amount of bycatch for the method identified as the worst in targeting tuna individuals in part A.

the  will improve the targeting of bluefin tuna.

**Item 1 (Part A)****SCORES**

Student scores on this item are as follows:

- No students earned 3 score points (full credit).
- Two students earned 2 score points.
- Four students earned 1 score point.
- Six students earned no score points.

**COMPREHENSION**

Several students expressed confusion with different aspects of this sub-question including

- completely missing two of the columns in the *Summary of Netting Fishing Methods* table, which was a critical reference for this sub-question; and
- confusion with the response-entry table, including overlooking the instructions stating that it was permissible to select more than one method for each column.

**REASONING**

All students methodically navigated through the response-entry table and used the *Summary of Netting Fishing Methods* chart in the stimulus to figure out their responses. For example:

- One student first lined up the *Summary of Netting Fishing Methods* chart next to the response-entry table so that he could read the descriptions easily and fill out the table. For the first column (*Likely to Catch the Greatest Number of Tuna Individuals*), the student said, “The first one I will cancel out will be *cast netting* because it says up to 100, and also *seine netting* because that’s less than 100. I would say *gillnetting* and *purse* [are] the two top because it says they catch up to 100s to 1,000s for both of those. Wait; sorry, I was reading that wrong. Okay, *midwater trawling* was 1,000s to 10,000s because that’s what I was thinking instead of 100s to 2,000s, so *midwater trawling* will be my answer.” The student continued in the same manner for each of the six columns.
- Not all the student’s conclusions from the *Summary of Netting Fishing Methods* chart were correct, however, probably because of deficiencies in the student’s knowledge about ecology. For example, for column 5 (*Likely to be the Best at Protecting Biodiversity of Ecosystem*), the student said, “I would say both *gillnetting* and *midwater trawling* because they both take all types of fish, they are not going after specific fish, which means that they’re not taking one species of fish out of the water; they’re taking multiple, so there’s less chance of one fish being taken out of the ecosystem.”

**Item 1 (Part B)****SCORES**

Six students earned credit on this sub-item.

## COMPREHENSION

One student was confused, saying that she did not understand the question and she did not know about each type of net.

## REASONING

In responding to this sub-item, four students referred to their responses in Part A, and four students referred to the *Summary of Netting Fishing Methods* chart.

### **Item 1 (Part C)**

## SCORES

One student earned credit on this sub-item.

## COMPREHENSION

Several students clearly did not understand the sub-item and guessed on questionable grounds.

For example, one student read out loud all of the options under the second drop-down menu and said that he did not really understand the question: “I’m confused because in re-reading the question, it makes it seem like it was asking which net would decrease the chance of getting a tuna, but re-reading the answer choices, it’s not asking that as much as I thought it would be. So, I’m going to go with *decreasing* instead of *increasing* because it says decrease in the sentence, and then something about negatives.”

Another student indicated that she initially thought the sub-item was looking for a change in any of the methods that would decrease the amount of tuna by catch. Later she realized that the sub-item was referencing something specific in Part A. She went through all the drop-down options and hesitated a lot over her answer, changing it several times.

## REASONING

In responding to this sub-item, five students referred to their responses in Part A, and six students referred to the *Summary of Netting Fishing Methods* chart.

**Item 2**

Item 2 of the Saving the Tuna cluster is shown in Figure 39.

*Figure 39. Item 2: Saving the Tuna*

The following question has two parts. First answer part A. Then, answer part B.

Three solutions proposed by scientific and environmental organizations to protect and restore the Northern Atlantic bluefin tuna population are shown in the table.

**Solutions to Protect and Restore the Bluefin Tuna Populations**

<b>Solution</b>	<b>Description</b>
1	Completely restricting the catching of juvenile bluefin
2	Limiting the total number of adult bluefin that can be caught
3	Removing juvenile bluefin from the Northern Atlantic to raise in captivity

**Part A**

Which Bluefin characteristic serves as the criteria on which all three solutions are based?

- Ⓐ body mass
- Ⓑ body length
- Ⓒ ability to reproduce
- Ⓓ ability to dive for prey

**Part B**

Select the **two** netting characteristics that are most important to consider when designing fishing nets for use in implementing the three solutions.

- ☐ mesh size of the net
- ☐ overall size of the net
- ☐ ability of the net to move
- ☐ depth of the net's location within the water column

**SCORES**

Student scores on this item are as follows:

- Three students earned 2 score points (full credit).
- No students earned 1 score point.
- Nine students earned no score points.

- Part A contributed one-third of the weight to the total item score, and 11 students selected the correct response for Part A.
- Part B contributed two-thirds of the weight to the total item score. Students only received credit for Part B if they correctly identified two netting characteristics that are important to consider when designing fishing nets for use in implementing the three solutions. While only three students correctly selected both characteristics, seven other students correctly selected one of the characteristics (four selected the *depth of the net’s location in the water* column, and three selected the *mesh size of the net* column).

## COMPREHENSION

One student did not understand the term “mesh size.” She understood mesh as a verb, e.g., “meshing things together.”

## REASONING

When responding to Part B, only one student referred to the *Solutions to Protect and Restore the Bluefin Tuna Populations* table included with the item; four students referred to the *Summary of Netting Fishing Methods* chart in the cluster stimulus, and two students referred to the text in the cluster stimulus.

The following is an example of how one student used the reference materials to draw two conclusions about how to design the net to protect and restore the tuna population. Rather than considering any of the solution strategies proposed in the cluster stimulus, the student seemed to focus on supporting a method that would selectively catch adult tuna rather than juveniles, but one of the net characteristics he identified (*depth of the net’s location within the water column*) counted as correct.

The student looked at the fishing method characteristics and said, “They’re going to want to increase the depth of the net’s location within the water column because the adults can dive as deep as 914 meters and can swim very long distances, so they’re going to want to increase the depth and the overall size of the net to catch them.” When asked where the student got the information to answer the question, the student said, “I looked at the top of the article where it says that they dive as deep as 914 meters and can swim very long distances in the open ocean. So, I said increase the overall size to make the catch wider so they can’t swim outside of the range of the net and also increase the depth since they can go pretty low.”

### 3.4.3 Cluster 3: Tomcods

#### *Performance Summary*

The median time to complete the Tomcods cluster was 17 minutes. Table 33 and Table 34 indicate the number of students attaining cluster total scores and item scores within the specified ranges, respectively.

*Table 33. Number of Students Attaining Cluster Total Scores in Specified Range: Tomcods*

Score 8–6	Score 5–4	Score 3–1	Score 0
0	1	9	4

Item 3	1	10	4

*Note.*  $n = 14$ ; one student ran out of time before completing this cluster.

#### *Task Demands*

The following are task demands of the Tomcods cluster:

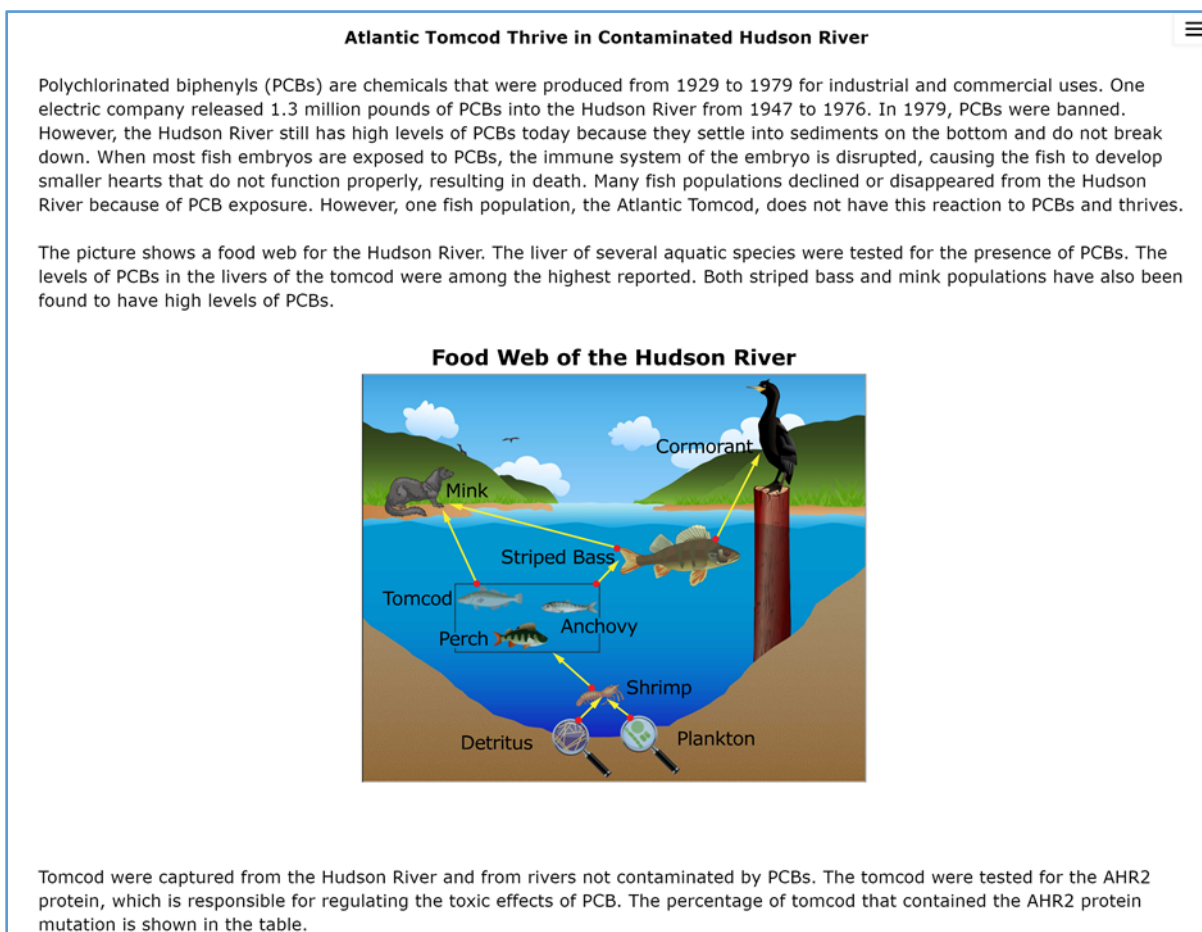

- Based on the provided data, identify, describe, or construct a claim regarding the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.
- Sort inferences about the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species into those that are supported by the data, contradicted by the data, outliers in the data, or neither, or some similar classification.
- Identify patterns of information/evidence in the data that support correlative/causative inferences about the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.

- Construct an argument using scientific reasoning drawing on credible evidence to explain the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.
- Identify additional evidence that would help clarify, support, or contradict a claim or causal argument regarding the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.
- Identify, summarize, or organize given data or other information to support or refute a claim regarding the effect of changes to the environment on (1) the increases in the number of individuals of some species, (2) the emergence of new species over time, and (3) the extinction of other species.

## Stimulus

The stimulus for the Tomcods cluster is shown in Figure 40.

*Figure 40. Stimulus: Tomcods*

Percentage of Tomcod with AHR2 Protein Mutation

River	Percentage of Tomcod with Mutation
Hudson River, New York	99
Hackensack River, New Jersey	92
Niantic River, Connecticut	6
Shinnecock Bay, New York	5

Following are two hypotheses about the success of the tomcod in the contaminated Hudson River.

**Hypothesis 1:** The tomcod population did not decrease in response to PCB exposure because tomcod do not take in as many PCBs as other fish species through their food consumption or absorption from the water.

**Hypothesis 2:** The tomcod population did not decrease in response to PCB exposure because they have evolved resistance to the effects of PCBs through natural selection.

As you work through the questions, evaluate the evidence to determine which hypothesis of how the tomcods are able to overcome exposure to deadly PCBs is **best** supported.

Reference: Isaac Wirgin, et al. "...Atlantic Tomcod from the Hudson River." *Science* 331 (2011):1322–1325.

## Details by Item

### Item 1

Item 1 of the Tomcods cluster is shown in Figure 41.

Figure 41. Item 1: Tomcods

The following question has three parts. First, answer Part A. Next, answer part B. Then, answer part C.

**Part A**

Select the boxes to indicate whether each statement supports or refutes Hypothesis 1 or Hypothesis 2. You can select more than one box for each statement.

	Supports Hypothesis 1	Refutes Hypothesis 1	Supports Hypothesis 2	Refutes Hypothesis 2
There is a higher percentage of AHR2 protein mutations in the Hudson River than in rivers not contaminated by PCBs.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
PCBs accumulate in striped bass and mink as a result of food consumption.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
There is a high level of PCBs in the liver of tomcod in the Hudson River.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
The tomcod population thrives in the PCB-contaminated Hudson River.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Tomcod feed on small PCB-contaminated bottom feeders but do not show any effects of PCB-exposure.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Part B**

Click on each box to select the word or phrase that **best** completes the statement.

is most probable because  the evidence supports this hypothesis and  the evidence refutes this hypothesis.

**Part C**

Select additional evidence to support the hypothesis selected in part B.

- ☐ The Hudson River shrimp and plankton do not take in as much PCB as the fish species.
- ☐ DNA evidence shows changes to the gene for AHR2 in the tomcod of the Hudson River.
- ☐ Changes to the AHR2 protein are acquired in response to environmental cues and are not genetic.
- ☐ The Hackensack River shares an estuary with the Hudson River, allowing fish to pass genes back and forth.

## **SCORES**

Student scores on this item are as follows:

- No students earned 5 score points (full credit) on this item.
- The highest score earned was 2 points, and this was achieved by two students, who each earned 1 point for Part A and 1 point for Part B. No one achieved any points for Part C.
- The remaining 12 students earned no credit.

## **COMPREHENSION**

It is hard to extract any detailed information on students' comprehension or reasoning because students floundered so badly on this question.

## **REASONING**

In Part A, most students did conscientiously work their way through the list of evidence and try to determine which supported or refuted each hypothesis, but their reasoning was substantially flawed, perhaps because they did not understand the applicable content knowledge.

For example, one student read out loud Hypothesis 1 and 2 in the introduction. She said, "So there's a higher percentage in the Hudson River than in rivers not contaminated," and selected Supports Hypothesis 1 for line 1 "because it's talking about how this one is saying that it's from the water and not from the fish." She read out loud part of line 2, looked quickly at the table in the introduction, and said that it's "actually going against it [refutes Hypothesis] because this one is talking about how it's because of the water not because of the fish, because of the food they are consuming, and they are not talking about the actual fish," then clicked Refutes Hypothesis 1. She read out loud line 3. She said she was going to select Refutes Hypothesis 1 because "it's the same as the first one, because it's saying how the species through the food, not the fish itself." She read out loud line 4 and immediately said that it supports Hypothesis 2 because "it's talking about how it is contained in the actual river, not the fish's fault, but the river's fault." She read out loud line 5 and said immediately that line 5 also supports Hypothesis 2 because, "of the natural selection."

Students who did not have good comprehension of Part A had even less chance of reasoning their way through Parts B or C, both of which built on conclusions from Part A.

**Item 2**

Item 2 of the Tomcods cluster is shown in Figure 42.

*Figure 42. Item 2: Tomcods*

The following question has two parts. First, answer part A. Then, answer part B.

**Part A**

Why were the tomcod able to survive in the presence of PCBs when other species were not?

- (A) The Hudson River tomcod did not absorb PCBs from the water.
- (B) All populations of tomcod species are resistant to the effects of PCB.
- (C) The Hudson River tomcod did not feed on species that were contaminated with PCBs.
- (D) The AHR2 mutation already existed in the Hudson River tomcod population at a low frequency.

**Part B**

Select the evidence that supports your answer.

- ☐ All tomcod tested in all rivers were resistant to PCB exposure.
- ☐ None of the Hudson River tomcod were found to contain PCBs.
- ☐ The AHR2 protein mutation is found at low frequency in tomcod from rivers not contaminated with PCBs.
- ☐ Less than 50 years after first exposure to PCBs, almost all of the Hudson River tomcod could survive in the presence of PCBs.

**SCORES**

Student scores on this item are as follows:

- Six students earned credit on Part A by choosing the correct explanation for why Tomcods can survive in the presence of PCBs.
- Three of those students also selected one of the pieces of evidence that supported their explanation, but they received no credit for Part B because they did not select both the applicable pieces of evidence.
- Three other students also selected one piece of “correct” evidence, but they had not chosen the right explanation in Part A, so it was unclear exactly what they were supporting.

**COMPREHENSION**

Although it was hardly the only reason why students had difficulty with this item, students were clearly challenged by having to pick more than one right answer in Part B, perhaps because they are not familiar with multi-select items and just stopped looking after they had made one selection. It might have helped to cue the students if the stem had specified that they had to select ALL the evidence that supported their explanation.

**REASONING**

The following is an example of the reasoning of one of the students who correctly identified option D as the reason why Tomcod survived in Part A,

The student read option A out loud and said, “That’s a lie! Because it says up there tomcod have a bunch of it, so that’s definitely a lie.” The student read option B out loud, saying, “I’m going to say No, because, in the [student looked back to the table on the left] Niantic River and the Shinnecock Bay, they did not have that mutation. So, I’m going to say B is wrong.” The student read option C out loud, saying, “OK wrong, because they eat the plankton and the shrimp, and they said earlier that they eat bottom feeders that have it.” Student read option D out loud and said, “Yes, because then they would have made it and had a bunch with that mutation.”

**Item 3**

Item 3 of the Tomcods cluster is shown in Figure 43.

*Figure 43. Item 3: Tomcods*

Why were other fish species in the Hudson River wiped out by PCB exposure, while the tomcod thrived?

- Ⓐ Other species do not contain a protein that regulates the toxic effects of PCBs, so they could not adapt quickly.
- Ⓑ Other species consumed more contaminated food than the tomcod, so they had more severe effects from PCB exposure.
- Ⓒ Other species absorbed the PCBs from the water more quickly than the tomcod, so they had higher concentrations in their bodies.
- Ⓓ Other species could not adapt quickly because they did not already contain a beneficial mutation in the gene pool to protect them from the effects of PCBs.

**SCORES**

Students did the best on this item; 10 students earned credit.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

Students who chose the right answer demonstrated plausible reasoning that supported the inference that the students had mastered the concept being tested.

For example, one student read out loud response option A and said, “That’s a good one, that might be the one.” He read out loud response option B and said, “That one does not make any sense because all fish, I’m assuming. [are] about the same size will eat about the same, and I know that goldfish don’t fill their stomach. I believe they go for all fish, they are all eating like crazy, so I would not click that one.” He read out loud response option C twice and said, “Again, that’s the same explanation for C as B, I would not click it.” He

read out loud response option D and said, “That’s the one I’m going to click, because that one is exactly referring to natural selection and . . . it’s like a gene, something in their mutation that they could protect themselves from the effects of it, but it’s in the gene pool and it’s referring to natural selection and the crossing of two species to get your genes and I would go with D, and A would be a close choice.”

### 3.4.4 Cluster 4: Tuberculosis

#### *Performance Summary*

The median time to complete the Tuberculosis cluster was 10 minutes. Table 35 and Table 36 indicate the number of students attaining cluster total scores and items scores within the specified ranges, respectively.

*Table 35. Number of Students Attaining Cluster Total Scores in Specified Range: Tuberculosis*

Score 5–4	Score 3–1	Score 0
1	9	4

*Note.* Maximum score = 5;  $n = 14$ ; one student ran out of time before completing this cluster.

*Table 36. Number of Students Attaining Item Scores in Specified Range, by Item: Tuberculosis*

	Maximum Item Score	Score 3	Score 2–1	Score 0
Item 1	3	1	5	8

	Maximum Item Score	Score 1	Score 0
Item 2 (Part A)	1	6	8
Item 2 (Part B)	1	1	13

*Note.*  $n = 14$ ; one student ran out of time before completing this cluster.

#### *Task Demands*

The following are task demands of the Tuberculosis cluster:

- Based on the provided data, make or construct a claim regarding inheritable genetic variations that may result from: (1) new genetic combinations through meiosis, (2) viable errors occurring during replication, and/or (3) mutations caused by environmental factors. This does not include selecting a claim from a list.
- Sort inferences about inheritable genetic variation into those that are supported by the data, contradicted by the data, outliers in the data, or neither, or some similar classification.
- Identify patterns of information/evidence in the data that support correlative/causative inferences about inheritable genetic variation.
- Construct an argument using scientific reasoning drawing on credible evidence to explain inheritable genetic variations may result from: (1) new genetic combinations through meiosis, (2) viable errors occurring during replication, and/or (3) mutations caused by environmental factors (handscored constructed response).

- Identify additional evidence that would help clarify, support, or contradict a claim or causal argument.
- Identify, describe, and/or construct alternate explanations or claims and cite the data needed to distinguish among them.
- Predict outcomes of genetic variations, given the cause and effect relationships of inheritance.

## Stimulus

The stimulus for the Tuberculosis cluster is shown in Figure 44.

Figure 44. Stimulus: Tuberculosis

### Antibiotic Resistant Tuberculosis

Antibiotic-resistant bacteria present a growing health care problem. The bacteria *Mycobacterium tuberculosis* (*Mtb*) causes the disease tuberculosis. One antibiotic used to treat tuberculosis is rifampin. Rifampin works by binding to amino acids 36-67 of the RNA polymerase protein of *Mycobacterium tuberculosis*. This binding makes the RNA polymerase protein inactive and the cell dies. This is illustrated below:

However, when treated with the antibiotic rifampin, some *Mycobacterium tuberculosis* bacteria are killed, but others survive. The bacteria that are killed are called “susceptible” to the antibiotic.

Scientists grow 3 mutant strains of *Mycobacterium tuberculosis* bacteria in a lab and sequence their DNA to compare to the wild-type strain that is not resistant to rifampin. Review the information provided.

#### Comparison of Mutant *Mycobacterium Tuberculosis* Bacteria to Wild-Type

Strain	DNA Sequence Change	Amino Acid Position	Amino Acid Change
<b>Mutant 1</b>	G to A substitution mutation	30	Alanine to Threonine
<b>Mutant 2</b>	C to A substitution mutation	51	No change
<b>Mutant 3</b>	G to T substitution mutation	46	Aspartic Acid to Tyrosine

As you work through the questions, evaluate the evidence to identify the source of genetic variation for antibiotic resistance in *Mycobacterium tuberculosis*.

## Details by Item

### Item 1

Item 1 in the Tuberculosis cluster is shown in Figure 45.

Figure 45. Item 1: Tuberculosis

If the rifampin cannot bind to the RNA polymerase protein in *Mycobacterium tuberculosis*, this leads to antibiotic resistance. Mutations in the rifampin binding site can block binding of the antibiotic. Based on the information provided, determine which mutants are likely to be resistant to rifampin by this mechanism.

Click on each blank box to select the correct words or phrases.

#### Resistance of Mutant *Mycobacterium Tuberculosis* Strains

Strain	Resistance	Explanation	
Mutant 1	<input type="text"/>	<input type="text"/>	<input type="text"/> of rifampin
Mutant 2	<input type="text"/>	<input type="text"/>	<input type="text"/> of rifampin
Mutant 3	<input type="text"/>	<input type="text"/>	<input type="text"/> of rifampin

## SCORES

One student earned 3 score points (full credit), and she was the only one to earn a point for correctly determining and explaining the resistance status of Mutant 3.

Five other students each earned 1 score point. Three of these students earned their point for correctly determining and explaining the resistance status of Mutant 2, and two earned their point for Mutant 1.

## COMPREHENSION

Four students reported that they found this item confusing and did not understand how to derive the necessary information from the stimulus.

For example, one student said that Item 1 was confusing and that it was not really addressed [in the stimulus]. He said he was doing a lot of “assuming” because “it’s talking about ‘resistant,’ and he only saw the word once.” He also said that “it seemed weird that all three of them would be not resistant,” although it is not clear on what basis he concluded that all three mutant strains were not resistant.

Four students reported using things they learned in science classes at school to help them respond to this item. For example,

- one student said that she knew about the amino acid from Biology in freshman year, and
- another student said that he learned about the topic in a biotech class two weeks prior to the interview.

## REASONING

All but two of the students referred to the comparison table in the stimulus when responding to this item; four students referred to the diagram.

Although only one student had the correct responses for all three of the mutant strains, several used the stimulus materials in the intended manner to reason through the problem.

For example, one student looked at the comparison table in the stimulus and said, “It says that the Rifampin works by binding to amino acids 36-67 of the RNA. And then it says down here that, because of the G to A substitution mutation, the amino acid positions at number 30, and then . . . it is resistant because it changed it from 36 to 30, so then the Rifampin can’t bind to it...So I would say it’s resistant, but there’s no change of rifampin—oh yeah, change to the—outside of the binding site.” “Mutant 2 changed it C to A. Mutant 2 changes the amino acid to 51, so there’s no change, so I’m going to mark *Not Resistant* because it’s still within 36-67, so I’m going to say no change inside the binding site.” “And Mutant 3 is a G to T substitution to 46. And 46 is still within 36-67, so I’m going to say *Not Resistant*, because there is a change from aspartic acid to tyrosine, Inside the binding site.”

**Item 2**

Item 2 of the Tuberculosis cluster is shown in Figure 46.

*Figure 46. Item 2: Tuberculosis*

The following question has two parts. First, answer part A. Then, answer part B.

**Part A**

What is the **likely** source of the genetic variation in antibiotic resistance of *Mycobacterium tuberculosis*?

Ⓐ new genetic combinations through meiosis

Ⓑ new genetic combinations through mitosis

Ⓒ viable errors occurring during DNA replication

Ⓓ sexual reproduction resulting in new combinations of traits

**Part B**

From the list of additional experiments, select the evidence that would support your answer in part A.

☐ Scientists grow a sample of wild-type *Mycobacterium tuberculosis* in the lab. Over time, some of the bacteria show resistance to rifampin.

☐ Scientists plate a colony of wild-type *Mycobacterium tuberculosis* and a colony of *Escherichia coli* in one petri dish. Some of the new colonies show resistance to rifampin.

☐ Scientists plate a colony of wild-type *Mycobacterium tuberculosis* and a colony of mutant *Mycobacterium tuberculosis* in one petri dish. Some of the new colonies show resistance to rifampin.

☐ Scientists create additional *Mycobacterium tuberculosis* mutants by creating substitution mutations in the DNA that codes for amino acids 36-67. Many of the mutants are resistant to rifampin.

**Item 2 (Part A)****SCORES**

Half of the students (seven students) earned credit on this sub-item.

**COMPREHENSION**

No features of this item appeared to confuse students.

**REASONING**

Three students looked back to one or more parts of the stimulus while working on this sub-item.

Four students said they used, or tried to use, material learned in school to help them respond to this sub-item. For example,

- one student said, “I am trying to go back to my knowledge of mitosis and meiosis and DNA replications,” and

- another student said, “Usually errors that occur during DNA replication can be bad, and I remember back from when I was a freshman that it’s not hereditary.”

Some students used test-wise strategies to make plausible guesses, so a correct answer did not necessarily represent full mastery.

For example, one student (who correctly selected C, *viable errors occurring during DNA replication*) said in his think aloud, “All this right now has to do with DNA . . . I don’t see anything about meiosis and mitosis on the chart.” When asked how he came up with his answer, he said, “I didn’t think it was A or B cause it’s talking about meiosis and mitosis, which was not discussed in the article, and then same with D. I did the viable errors because it’s talking about DNA strands, so that’s why I chose C.”

## **Item 2 (Part B)**

### **SCORES**

Only one student earned credit for this sub-item. In part, the difficulty resulted from an incorrect interpretation of the sub-item, as explained further in the Comprehension section below.

Of the two correct options, five students selected *Scientists grow a sample of wild-type Mycobacterium tuberculosis in the lab . . .* and seven students selected *Scientists create additional Mycobacterium tuberculosis mutants by creating substitution mutations in the DNA . . .*

### **COMPREHENSION**

To earn credit for this item, students had to select both the experiments that could provide evidence to support the conclusion they selected in Part A. However, this is not clearly stated in the instructions, so most students stopped after they thought they had found one relevant experiment. Only three students marked two options, and two students said that they thought that they were only allowed to choose one option.

One student expressed confusion with the second response option. He did not know what *Escherichia coli* was and the relationship might be between it and *Mycobacterium tuberculosis*.

### **REASONING**

At least four students referred to the text, diagram, and/or comparison table when responding to this sub-item.

### **3.5 STUDENTS' OVERALL PERCEPTIONS OF THE TEST**

#### **3.5.1 Topics Studied**

##### ***Elementary School (n=18)***

- Eleven students reported that they had studied topics related to the Desert Plants cluster, such as the life cycle of a plant and how plants survive in a desert habitat.
- Ten students had studied topics related to the Grand Canyon cluster, although not all of them learned about fossils or contemporary animals that can be found in the canyon. One student learned about fossils and rock formations as part of the history of Utah.
- Nine students had studied topics related to the Terrarium Matter Cycle cluster, such as “plants have carbon dioxide, but a whole plant needs water, soil, and sun,” and some had conducted an experiment in which one group of students tried to grow plants in a dark environment and another group tried to grow plants in the sunlight.
- Although no students were familiar with topics related to the German Pyramid Candle cluster, five students had studied heat transfer.

Generally, each of the Utah students had studied more of these topics than the California students, and their lessons were more closely aligned with the topics of the science clusters. One of the Utah students said he had studied all four of the topics:

“At the beginning of the year we studied the heat one and how we can help make a motor turn something on, like a light bulb. I thought of that. Maybe it was just backwards, the light was helping the fan to spin. The light was turning or making it spin by the energy it was producing. I remember last year in 4th grade we studied the Grand Canyon and the animals, and we did a little bit this year, and the animals that were living in the walls like trilobite and some others like starfish. We saw this video of this hole that was in Arizona, and there were tons of fossils in it. I think we studied a little bit on the terrarium one . . . We studied a little bit about [the desert plants]. About how each plant could survive.”

##### ***Middle School (n = 12)***

- Nine of the 11 students who responded to the Galilean Moons cluster question reported that they had studied related topics, such as moons, the solar system, space, and the planets, although their studies were not as in-depth as the animation and the data table.
- Only three students had studied the water cycle or how it applied to fog.
- Four students had studied some aspects of weather, including warm and cold fronts, but not as in-depth as the Texas Weather cluster.
- Eight students had studied animals and the types of relationships between animals, although not necessarily about hippos.

### ***High School (n = 15)***

- Thirteen students reported that they had studied topics related to the Tuberculosis cluster, such as DNA, mutations, mitosis, meiosis, and amino acids.
- Seven students had studied topics related to the Blood Sugar Regulation cluster, although not as in-depth as these questions. In referring to the Blood Sugar Regulation cluster, one student said that they had reviewed molecule concentrations but never discussed meals or “not that in-depth, more gone over these and what they do for the body.” Another student said she had studied feedback loops and homeostasis.
- Five students had studied topics related to the Tomcods cluster, such as the food web, ecology, and PCBs.
- Only two students said that they had studied topics related to the Saving the Tuna cluster, but they did not provide any information about which specific topics.

### **3.5.2 Use of Similar Online Tests and Tools**

#### ***Elementary School (n=18)***

All but one student had previously taken online tests; the subjects of the tests varied and included science, mathematics, reading, and/or “grammar.” The online tests they had used included Galileo, SALT, ATI, and, for the Utah students, SAGE.

All but one of the students said that they had used similar online tools, including being able to expand the screen from left to right and vice versa; videos; dictionaries; navigation buttons such as arrows, a scroll bar, Back, Next, and Zoom in/Zoom out buttons; and drop-down menus. One student said that her previous experience with online tests involved individual questions rather than clusters, and another student said that there were “more pictures to move around” on the other online test.

#### ***Middle School (n = 12)***

All 11 students who responded to this question had previously taken online tests; the subjects varied and included science, mathematics, and/or English language arts.

All but two of the students said that they had used similar online tools (including the Connect Line tool and Graphing tool for plotting points), animations, videos, and navigation buttons such as the Next, Back, Pause, and Zoom in/Zoom out buttons. One student said that he previously had to draw lines, but only straight lines, nothing like the graphs she had to draw in the Morning Fog cluster. Another student mentioned that layout of the items was familiar, including having the stimulus on the left side of the screen and the questions on the right side.

#### ***High School (n = 15)***

All but two students had previously taken online tests; the test subjects varied and included science, mathematics, and English.

All but one of the students said that they had used similar online tools including at least one of the following: graphs, diagrams, the Connect Line tool, checkboxes, and a layout that presented a stimulus on one side of the screen and the associated questions on the other side. One student said that a standardized test he took the previous day was exactly the same, “the interface is the same,” although he was not able to expand the screen on the standardized test. One student mentioned two other functionalities that he had used on other tests: the Highlighting tool and the ability to add a note to a paragraph and view it later.

### 3.6 OVERALL THOUGHTS ABOUT TEST DIFFICULTY

#### *Elementary School (n=18)*

Nine students felt that the test had both easy and hard parts and described the overall difficulty as “in between.” Examples include the following:

- One student said, “I think the test was in between those because some of it I got confused on and some other pieces like this [referring to Item 1 of the Redwall Limestone cluster] was easy since it gave us these maps about where it lived and the rest was kind of simple. For this one [referring to Item 2 of the Redwall Limestone cluster], it was simple.”
- One student said, “Some of them were hard, some of them were confusing, some of them were easy – that’s how I feel about this test. The hardest part was [the Terrarium Matter Cycle cluster], question two, Part A [of the Terrarium Matter Cycle cluster] because “I didn’t understand what they meant about X, Y, and Z – I had to think about what they mean.”
- Another student thought the test was “right in the middle, good. It wasn’t too easy or too difficult.” The student did not find any of it particularly confusing.
- Five students described only one of the items as being difficult, and four of the five students said the hard item was Item 2 Part A in the Terrarium Matter Cycle cluster. Examples include the following:
  - One student said, “There was one I skipped. I didn’t really like that. Because there was too much going on,” referring to Item 2 in the Terrarium Matter Cycle cluster.
  - One student felt that the hardest question was on “the terrarium with the diagram and the X, Y, and Z stuff. The others you just had to think about, and you could solve them.”
  - Another student said, “Overall, I think it’s really good. I found the terrarium a little confusing. It is a good test to have about things you need to know.” When asked if the questions were hard or easy, the student said they were easy except for the terrarium question. He said he got confused on the circle of energy.

By contrast, four students expressed that the test was easy. Examples include the following:

- One student did not feel like any of it was confusing, and he was not nervous. He thought the questions were very specific. It was easy for him to navigate through the tools and figure out how to answer the questions.
- One student said, “It took some time for me to think of the answers, but I thought it was pretty easy.”

#### *Middle School (n = 12)*

All 12 students responded to the end-of-test question on what they thought of the test. Seven of the students felt that the test was not too hard. For example:

- One student thought that the questions were reasonably easy but were hard for someone who hadn't learned a lot of this material. She said that, in general, she is well educated in science, but a lot of these topics are "very random." The student felt like she could have told the interviewer about the water cycle, but not how it works in this specific scenario.
- One student said that the test "was good, yeah. It wasn't hard." The student said that Item 3 of the Galilean Moon cluster was hard.
- Another student thought the questions got harder as she went along, and the hardest problem was the Texas Weather cluster. She had to reread some of the questions, but overall, she thought they were clear.

By contrast, five students expressed that the test was difficult or challenging. For example:

- One student thought that the test was good, but kind of difficult. She mentioned that students like her brother, who is dyslexic, would find it helpful to have the questions read out loud to them. She also said some of the questions were harder because she hadn't gone over the content yet and didn't know what some of the moons were.
- Another student thought the test was "pretty difficult." It was confusing for the student because she had to go back and reread items to understand the process and how to figure it out.
- A student said it was definitely "more challenging" than tests he had taken.
- A student said, "I thought it was kind of confusing. We've studied the moon one a bit, the hippos for sure, and then the water cycle and the temperature we haven't, so for doing all of those for my first time, I couldn't quite make it out. I was totally lost on the Morning Fog in the Valley."

### ***High School (n = 15)***

All 15 students responded to the end of the test question on what they thought of the test, although three students did not comment on whether the test was easy or difficult. (One of these latter students described it as "pretty interesting" and "different." Another said he liked the multiple-choice items, the diagrams, tables, and having multiple parts to a question.)

Ten students felt that the test was in the "middle range" of difficulty, with some questions being clearer than others. Four students felt that the Tomcods cluster was confusing, and three students felt that the Blood Sugar Regulation cluster was confusing.

Two students described the test as being difficult. One of these students said the test did not relate to his past studies, but he thought it would be a good test for students who were studying these topics. He also said the types of questions were different than he was used to: – "it's not like normal standardized testing kinds of questions." The student noted that he had not studied these topics even though he was an Advanced Placement (AP) Biology student. Consequently, he was unsure who the target audience of the test might be. The other student mentioned that she found the questions "kinda hard" because there were so many parts to each question. The reading parts were clear, but the structure of the questions could be confusing, according to the student.

## **1. INTRODUCTION**

This set of cognitive labs was designed to determine if students using braille can understand the task demands of selected interactive Next Generation Science Standards (NGSS)-aligned science clusters and navigate the interactive features of these clusters in a manner that allows them to fully display their knowledge and skills relative to the constructs of interest. The clusters for the study were sampled from those that had already been selected for braille translation. The cognitive labs were designed to address the following three research questions:

1. Can students using braille provide responses to the selected interactive NGSS-aligned science clusters that are consistent with their knowledge and skills relative to the constructs of interest?
2. Within the selected clusters, can students successfully navigate all the included interaction types, or are further modifications needed to make the clusters fully accessible?
3. How much time do students using braille require to work their way through the selected clusters, and what strategies can be recommended to enable students using braille to complete clusters within a single testing session (to improve continuity)?

Although the American Institutes for Research (AIR) team was able to collect relevant data for this cognitive lab study, there were some limitations to the analysis. Most importantly, there were far fewer eligible visually-impaired students willing to participate in the study than anticipated, and some of them, although technically readers of braille, did not use braille while responding to the science questions in the cognitive labs. In addition, in several of the cognitive lab sessions, students' interactions with the clusters was hampered by technical issues with the Job Access With Speech (JAWS) screen-reading software and/or the Refreshable Braille Display (RDB) supplied locally, as well as by text-to-speech (TTS) tagging or braille embossing problems that arose in the beta-version materials. The latter were used in the cognitive labs due to the timing of the study.

## **2. METHODS**

### **2.1 STUDY DESIGN**

Two science clusters were sampled for each grade band (i.e., elementary, middle, and high school), and tailored protocols were developed for each cluster. The original design called for a minimum of six cognitive labs at each grade level, but due to recruitment challenges (discussed further in this section), labs were only conducted with ten students in total. The cognitive labs were held in Oregon and West Virginia between October 2018 and January 2019. The interviews lasted two hours, and each student was presented with one or both clusters for their grade band, depending on how much time the student took to complete the first cluster.

As part of the cognitive lab introductory activities, students were trained in the concurrent think-aloud technique. Using an elementary-level science cluster, which was not one of the clusters evaluated in the study, the interviewer first modeled the technique in Part A (first scored question) and then had the student practice in Part B (second scored question).

Students then moved on to their first assigned cluster. They were encouraged to think out loud as they worked through the cluster, and interviewers were instructed to use follow-up probes to clarify and expand on what the student said (or what the student was observed doing). Probes, which were tailored to the specifics of the cluster, focused on whether the student was able to find all the information needed to respond to the questions, what the student thought about the ways in which they had to enter answers to questions (for questions with innovative response formats), and if they would change anything about the way the information was presented to make it easier to work on the questions. A final probe allowed the student to report on anything else they found notable about the questions or introductory material in the cluster.

Students who were able to complete the first cluster by the 1.5-hour mark (out of the scheduled 2-hour lab) were moved on to the second cluster for their grade band. Probes were only administered after the student had completed all the questions in a given cluster in order to ensure that probing on the earlier questions would not influence the student's interactions with the later questions.<sup>1</sup>

Interviewers brought embossed braille forms to the cognitive labs. The site was responsible for providing other resources, such as JAWS and an RBD. AIR requested that a teacher of the visually impaired (TVI) or a teacher assistant be present in the room during the cognitive lab and assist the student as they would during an actual test. In most cases, prior to the interview, the interviewer briefly discussed with the TVI/teacher assistant what resources the student used to navigate online tests and how frequently/in what ways the TVI/teacher assistant typically assisted the student during testing. This information helped the interviewer to further tailor their probes and observations.

## **2.2 INTERVIEWER TRAINING**

The project leads provided a 4-hour training for the interviewers who would be conducting the cognitive labs. Because all the interviewers were experienced in the cognitive interview technique, the training primarily focused on reviewing the content of the clusters and familiarizing the interviewers with the test platform and the specifics of the cognitive lab protocols. An assessment program manager was present at the training to provide an overview of the test platform and to respond to any technical questions.

## **2.3 STUDY SAMPLE**

Permission to recruit students for the study was secured from four states. In each state, the project manager and project director worked with relevant school and district personnel to recruit eligible students and coordinate logistics. Ultimately, only two states, Oregon and West Virginia, were able to provide students for the study.

The recruitment materials specified a need for students in grades 6, 7, 9, 10, or 12 who use braille, and all the recruited students were in fact able to use braille to some degree; however, an unanticipated complication was that some of the students who were partially sighted chose to use other resources (e.g., the Zoom tool) to navigate the clusters. Given that there were so few students

---

<sup>1</sup>To stay within the agreed-upon 2-hour time limit, the interviewer sometimes stopped the student before they finished the second cluster in order to leave sufficient time for probing.

available, the AIR team took whomever was recruited. The characteristics of the sample, by student, are shown in Table 1 below.

Students in grades 6 and 7 were administered the elementary-school-level clusters, students in grades 9 and 10 were administered the middle-school-level clusters, and students in grade 12 were administered the high-school-level clusters.

*Table 1. Characteristics of Sample, by Student*

Student	Grade	Gender	Resources Used in the Cognitive Lab
1	6	Male	JAWS, RBD, braille*
2	6	Female	Zoom, larger cursor
3	9	Male	Zoom, larger cursor, JAWS, braille
4	9	Male	Zoom
5	9	Male	JAWS, RBD
6	10	Male	JAWS, RBD, braille
7	10	Female	Braille, ChromeVox**
8	10	Female	Zoom
9	12	Female	Zoom, JAWS, braille
10	12	Male	Inverse colors, zoom

*Note.* \*Braille refers to the embossed braille forms

\*\*ChromeVox is an alternative TTS reader.

### 3. FINDINGS AND RECOMMENDATIONS

#### 3.1 RESOURCES USED

The students used the available resources in a variety of ways during the cognitive labs. It was common for the students to switch between resources (e.g., moving between embossed braille, JAWS [sometimes coupled with an RBD], the Zoom tool [where relevant]). Some of the partially-sighted students chose to use only zoom, citing reasons such as having only “beginner” level braille skills or feeling that navigation using braille took longer; others switched between the Zoom tool and other resources. One TVI reported that the partially-sighted student they were assisting switched based on “eye fatigue and lighting conditions.” At least two students used the embossed braille forms almost exclusively to read the questions and reference the introductory materials, but switched to JAWS to enter their answers. One of these students reported that they used the embossed braille forms because it was easier than scrolling up and down the page using JAWS. Another partially-sighted student used the embossed braille forms and a screen reader similar to JAWS, but they also looked very closely at the screen to see where to place the cursor when responding to the questions.

Two students, one assigned to a middle school cluster and the other assigned to a high school cluster, reported that they would normally be offered a Perkins Braille (also called Perkins Braille Writer) to take notes during testing. The AIR team did not anticipate or provide this resource,

which is the equivalent to scratch paper for a braille user and is a standard accommodation for visually-impaired students in testing situations. It can also be used by the student to type the answers in braille, after which the TVI/teacher assistant can transcribe the answers and enter them into the test system.

### **3.1.1 Hardware and Software Resources**

As mentioned previously, there were technical issues with some of the locally-supplied resources used in the cognitive labs. In both states, JAWS often did not work smoothly, and there were instances in which the RBD did not operate at all. As a result, some of the students struggled more with navigation than they usually would. In a couple of cases, these students reported depending more on the TVI/teacher assistant and embossed braille forms than they normally would have.

One TVI noted that every difficulty that their student encountered had come up in a real testing situation—problems with the RBD crashing, unpredictable behavior with JAWS, and “bad” embossed braille forms. The TVI said that, even when everything is tested in advance (as the RBD is), resources still do not necessarily work inside AIR’s test delivery system (TDS).

### **3.1.2 Embossed Braille Forms**

Students were generally taken aback when they first realized the number of pages in the embossed braille forms, and, with no prior exposure to the science clusters, they had not anticipated or prepared for the need to keep track of information across multiple pages. Most of the other challenges that students experienced with this resource arose from inadvertent errors in the beta-version forms. Some of these errors were fixed after the first cognitive lab, but others persisted. In a normal cognitive lab study with a larger subject pool, all protocols would be pilot tested, which would have offered an opportunity to fix problems like this before the materials were used in the actual study.

However, some students also reported encountering graphical elements that—as rendered—were difficult to discriminate on the embossed forms. For example, one student reported that it was hard to differentiate between the two graph lines that, in the print version, were distinguished by different tones of grey. Another student indicated that it was difficult to discern the overall layout of a map of the United States, in which some states were highlighted for sharing a common characteristic, because the state lines, the line marking the boundary of the United States, and the lines outlining the Great Lakes were all too similar.

Regardless of these various issues, most students felt that the braille forms were easier to work with than using JAWS.

### **3.1.3 JAWS and Other Online Navigation Issues**

There were significant problems with JAWS that prolonged the time it took students to work through the clusters. Some of these problems were caused by TTS-formatting configuration errors that were not caught in advance, but others had to do with the way in which JAWS was set up by the TVI/teacher assistant. An example of the latter was an instance in which JAWS was accidentally set to read all the navigation marks and not just the substance of the text. Proper settings are covered in the *Braille Requirements and Testing Manual*, but were not discussed with the TVIs/teacher assistants who were preparing for the cognitive labs.

Other challenges were caused by conventions with which the students were not familiar. In particular, students often appeared confused when JAWS skipped over a table or figure that had been judged as too complex to be read successfully by JAWS. It might have been helpful if the TTS tagging had included embedded text that instructed students to switch to the screen image or the embossed braille forms in order to see the contents of the table or figure.

For tables that were read by JAWS, at least one student noted that it would be helpful for JAWS to indicate when the table was entered and exited, rather than just reading “table of checkboxes” multiple times as it progressed through the table; however, it was not clear whether the student had JAWS set up correctly.

Several students had difficulties using the Tab key effectively, repeatedly finding themselves in some other location than they expected when they tabbed forward or back. There seemed to be some interaction between problems with tabbing and the students’ confusion about JAWS not reading the tables and figures (however, it should be noted that one student, who did not have any problems navigating with JAWS, said that it would have been very helpful to be able to easily tab between the question stem and the response fields so that students could quickly review the question—potentially multiple times—as they considered their response).

Finally, there were issues associated with the way in which drop-down boxes were handled by JAWS. Some students were not familiar with the term “combo boxes,” which was used to describe these boxes, and many students were confused by the ways in which JAWS handled the response options for these boxes. In some cases, it appeared that JAWS did not read these choices at all (which was consistent with the current TXX business rules), while in other cases JAWS read the options, but only after a response was selected. Finally, the tagging may have been inadequate, as at least one student didn’t understand what JAWS was reading until the TVI showed them where the various parts of the question were, especially the text in the drop-down boxes.

### **3.1.4 Zoom Tool**

Students who used the Zoom tool did not encounter many problems applying this tool to the science clusters, although one student failed to discern at least one drop down box as they moved through the text. These students did, however, suggest several modifications that they felt would improve their experience, including the following:

- Enable the user to change the size of tables or images on all sides rather than just two sides to avoid having to scroll sideways.
- Add additional spacing in the text; at x3 or greater zoom, the spacing is too tight.
- Make the sizing of the answer buttons consistent when zoomed in—currently the answer buttons on the multiple-choice questions stayed small, whereas other answer buttons got larger when zoomed in.
- To help with viewing the drop-down boxes (see example in Figure 1), format the boxes with high contrast or a thicker line.

Figure 1. Example Drop-Down Box

Variable for vertical axis of Graph A:

**Graph A**

### 3.1.5 Assistance from the TVI/Teacher Assistant

The level of TVI/teacher assistance varied in relation to the student's fluency with the other resources. An added factor in the level of assistance provided to students in the cognitive labs was the failure of the RBDs in some sessions. Without the RBD, students who could not see the computer screen required assistance to enter their responses.

The most facile student in our sample, who was very comfortable using both the embossed braille forms and JAWS, still asked for some assistance from the TVI, particularly with online navigation. At the other end of the scale, the following vignette illustrates how one TVI worked with a student who needed considerable support.

*Example of a TVI assisting a student who was not very facile with the other resources available.*

One student began by letting JAWS read through the entire introduction and most of the questions before asking if they could pause it. The TVI gave the student the instructions to do so. The student said that they were being hit with too much information at once, so they asked for the embossed braille form. The TVI found the first page and directed the student through most of the content, reading a lot of it out loud. The TVI noted that this was an official accommodation that the student was allowed to use during tests. The student had difficulty reading the braille out loud—stumbling over words and parts of words and asked the TVI for a lot of help with the figures. When the student had trouble reading Table 1 (included in the introduction) on the braille form, they decided to go back to JAWS. JAWS jumped ahead to Table 2 (part of the first scorable question), and it took some effort for the student to go back to Table 1. The TVI helped the student find Table 1, and the student followed along on the braille form as JAWS read the text preceding Table 1 out loud; however, JAWS did not read Table 1, instead skipping to the next paragraph of text. The student wanted to try typing on the keyboard to see if it would help bring up the table, but the TVI explained that there was no text box to type anything into. The TVI suggested that the student tab forward. The TVI said that in a real test situation, she would offer to read the table at this point. The student said this would be helpful, and the interviewer indicated that this was acceptable, so the TVI read the table out loud while the student followed along on the braille form.

### 3.2 GENERAL ACCESSIBILITY ISSUES

An accessibility issue that, although it primarily affects the embossed braille forms, also has implications for screen layout, has to do with the inconsistent locations in which cluster components (e.g., questions, tables and figures, other text) appear on the page. Without the ability to quickly discern the overall layout of each page or screen, it was much harder for students in the study to process the information being conveyed. One student mentioned that it would be helpful if question stems consistently appeared on the top of the page, as in some cases the display that follows the item identifier (e.g., Part A) starts with a table or other graphic, with the text of the item stem following. Given the student feedback, it would be better to position the table/graphic below the item stem. Another student was observed to completely overlook a short paragraph of text that appeared between two large graphics in the introduction. Moreover, there were no sufficient cues to alert the student to the fact that they had missed an element. When blocks are being prepared for braille readers and other visually impaired students, it would be helpful to take these considerations into account and modify the page and screen layouts accordingly.

Similarly, one student's thoughts about how they would use the various resources to efficiently work through the science clusters (see graphic below), suggest another modification that would help maximize accessibility.

*Thoughts from a student on how to best use resources to work through the science clusters.*

Both the student and their TVI noted that working with the embossed braille forms for the science clusters was a departure from their usual testing experience because most traditional test questions can be rendered on a single page. Upon reflection, the student said that the strategy that would work best for them would be to

- first read through the whole cluster using the embossed braille form; and then
- navigate the questions with JAWS and an RBD, referring back to text passages as needed using these tools; however, where there was a need to refer back to a figure or chart, use the embossed braille.

The student indicated that to successfully carry out this strategy, they would need a better system for keeping all the braille pages organized so as to be able to quickly access the necessary graphics. Providing an index, or some form of page headers, might help with this problem.

### 3.3 TIMING AND CONTINUITY

One of the goals at the beginning of the study was to determine whether students could complete an entire cluster during a single testing session; the results suggest that timing will not be a major issue, so long as schools are able to provide uninterrupted 1-hour testing sessions, if necessary. Despite the technical issues with JAWS, the RBD, and the braille forms, all but two of the students were able to complete at least one of the clusters during the cognitive labs, and one of the students who failed to complete the cluster was not focused or motivated to respond to the questions. The labs were approximately 1.5 hours long, not including the introduction and think-aloud modeling

and practice. Given that they involved thinking aloud and probing, as well as working the questions, 1-hour testing sessions should be sufficient for actual administrations.

## 4. CONCLUSIONS

In general, both the students who relied entirely on braille and/or JAWS and those who had some vision and were able to read the screen with the Zoom tool were able to find the information they needed to respond to the questions, navigate the various response formats, and finish within a reasonable amount of time. To varying degrees, assistance from the TVI/teacher assistant was necessary, but this was most likely not qualitatively different from the assistance that would be provided on a more traditional test.

However, the clusters were clearly different from (and more complex than) other tests with which the students were familiar, and students should be given adequate time to practice with at least one sample cluster before taking the state test. It would also be helpful for students to work with their TVIs/teacher assistants in advance to develop a strategy for organizing and using the information required to answer the test questions. For example, students might want to take notes on a Perkins Braille as they work. Given that the challenges of the science clusters are not unlike the challenges that students are likely to encounter under curricula based on NGSS or Common Core State Standards (CCSS) or their equivalent, students could be expected to become more fluent in the requisite skills as such curricula become more widespread.

Because of the large numbers of substantively important figures and tables in the clusters, we judge the embossed braille forms to be essential for any student who cannot see the material on the screen with magnification. Embossing is already set to “automatic” on all AIR science tests; however, in the case of the science clusters, test administrators (TAs) should be instructed to have the forms available before the student begins work on a given cluster, as the embossing would otherwise be very disruptive.

A major challenge that we observed in the cognitive labs—which would apply to more conventional tests, as well—was the temperamental functioning of JAWS and the RBDs. There were multiple instances of these resources failing during the cognitive labs, even when they had been tested in advance. This might be avoided with more rigorous user acceptance testing (UAT) of items using JAWS, but it also might require changes at the local level, such as better training for TVIs/teacher assistants or better maintenance of the devices.

Among the innovative response formats encountered in the science clusters that were used in the cognitive labs, the drop-down boxes proved to be the most problematic (specifically for students who were trying to navigate the science clusters using JAWS), since the drop-down options were not tagged to be read by JAWS. AIR should consider changes to the business rules in order to allow the drop-down options to be read.

The following recaps the tool-specific recommendations offered in the report.

For braille forms,

- make sure that graphic elements, such as graph or map lines, are bold enough or sufficiently contrasted to be easily discriminated;

- consider reformatting so that page layout is more predictable (e.g., always keeping text together rather than interspersing it with large graphics); and/or
- consider adding an index or page headers to make it easier for students to keep track of information across multiple sheets of embossed braille.

For JAWS,

- provide more cues when a student needs to switch to the braille form or the screen image to view a table or figure that JAWS will skip over;
- add navigation markers to indicate when the reader is entering or exiting a table if tables are tagged to be read by JAWS; and/or
- provide a way for the student to readily tab between the question stem and the response field(s).

For the Zoom tool,

- enable the user to change the size of tables or images on all sides rather than just two sides to avoid having to scroll sideways;
- add additional spacing in the text; at x3 or greater zoom, the spacing is too tight;
- make the sizing of the answer button consistent when zoomed in—as currently configured, the answer buttons on the multiple-choice questions stay small, whereas other buttons get larger when zoomed in; and/or
- format the boxes with high contrast to help with viewing the drop-down boxes.

**Appendix 4-F**  
**Alignment Study Executive Summary**

## **Executive Summary**

The WebbAlign team of the non-profit Wisconsin Center for Education Products and Services (WCEPS) facilitated a study in July 2019 to evaluate the alignment of a Shared Science Assessment Item Bank with the Next Generation Science Standards' (NGSS) Performance Expectations (PEs). The item bank is managed by Cambium Assessment (CAI), (formerly known as American Institutes for Research; AIR) and is shared by multiple states, 10 of which were involved in the 2019 study. Each state uses its own assessment blueprint and a particular state-vetted subset of items from the shared item bank. Some states' science standards include slight adjustments from the wording or scope of the NGSS. This report describes the overall results of the alignment analysis of the item bank, applicable to all states. Separate state-specific reports provide additional detail relevant to each state including item-level, test-event-level, and item-bank-level findings.

The alignment analysis was designed to yield evidence that could (as appropriate, pending results) substantiate state claims about what the assessments measure as well as state interpretations of student scores in relation to the NGSS. This includes the evidence required for submission to federal peer review and reflects the input, discussions, and decisions of participating states, feedback from the VT/RI (MSSA) Technical Advisory Committee, and the takeaways from a small-scale trial of alignment methodologies using item clusters from the item bank. The methodologies used for the alignment analyses synthesize current thinking and specific considerations as relates to NGSS alignment as well as core tenets of evaluations of alignment of standards and assessments that meet U.S. Department of Education expectations.

The in-person item-level content alignment analyses were conducted in Denver, CO on July 15-19, 2019 with panelists from all 10 states. Ten to twelve educators for each grade band (elementary, middle, and high school) were split into two panels of five and/or six. Panels were expected to have appropriate state representation as well as education and science content/discipline experience and expertise. The first day of the meeting was dedicated to large-group and small-group training and practice, as well as a thorough content analysis of the standards by grade band panels to promote a shared interpretation of their meaning. On days two through four, panelists completed a content analysis of all operational assessment stand-alone items and item clusters (available at the time of the study) within the Shared Science Assessment Item Bank. Group leaders had content area and NGSS expertise as well as previous experience with WebbAlign alignment analyses. Group leaders worked in advance with the Study Director to prepare for study facilitation.

Research questions, alignment criteria, and acceptable cutoff levels for these criteria as relate to corresponding science standards and assessments were determined through discussion with state officials, and grounded in analyses of test purpose, construct, and blueprint. For NGSS assessments, judgements of acceptability of alignment must relate to and be informed by the specifics of the structure of the standards and the assessment design and construct. For example, states expected item clusters to require students to engage with all three dimensions of the standards while stand-alone items could require engagement with two or three dimensions of the standards. State officials were asked to confirm the full set of criteria used and review the acceptable levels proposed for each alignment criterion. States were provided the opportunity to make modifications if warranted. The data collection and reporting for the analyses used the finalized alignment criteria and corresponding cutoffs, appropriate for the context of the states' intents and for the particular context of alignment of science assessments with corresponding NGSS PEs.

The study addressed four key research questions:

1. To what extent do the stand-alone items and item clusters satisfy the measurement target claims (PE and scoring assertions) identified in the CAI metadata?
  - a. To what extent does an independent expert panel agree that a student's correct response allows for a reasonable inference about the student's proficiency as relates to the three-dimensional expectations within the identified PE?
  - b. To what extent does an independent expert panel agree that the explicit inferences about student performance stated in the scoring assertions can reasonably be made based on student responses to a stand-alone item or item cluster?
  - c. To what extent does an independent expert panel agree that the explicit inferences about student performance stated in the scoring assertions reflect the states' measurement target claims (PE) identified in the CAI metadata?
2. What Category of Engagement (cognitive complexity) is required for successful completion of each interaction within a stand-alone item or item cluster and how does this compare with the Category of Engagement assigned to the corresponding PE?
3. To what extent do the stand-alone items and item clusters satisfy the claim that the assessment is phenomenon-based?

4. To what extent are state-specific assessment programs likely to generate test events that are aligned with corresponding grade-level academic standards, considering depth and breadth (specified in ESSA) as well as other alignment criteria?
  - a. Do the test blueprints and other relevant test specifications and documentation reflect appropriate design to support potential alignment of test events with corresponding grade-level academic standards?
  - b. Do the available aggregate data for recently administered test events in each state provide evidence that the algorithm and blueprints yielded test forms as expected?
  - c. To what degree are actual test events for each state (if available) aligned with corresponding grade-level academic standards for each state?

The overall study was crafted to allow for the potential to build a logic argument for the capacity for alignment of all test events generated by the Shared Science Assessment Item Bank with corresponding state standards, as appropriate, based on results. As such, the study was designed to generate multiple lines of evidence that could be used to support a claim that the item bank had the capacity to yield aligned test forms for each state. These lines of evidence, along with the resulting claim, stated in the positive, would be:

- If an independent content alignment analysis of all stand-alone items and item clusters from the item bank showed that the items and item clusters were appropriate as related to intended claims and inferences,
- and if a state's test blueprints and item selection algorithm were generating test events as intended (based on data from all administered test events within that state),
- if an independent content alignment analysis of sample state test events showed acceptable alignment to corresponding standards according to agreed-upon criteria,
- then it is possible to make an argument for the capacity of alignment for all test events resulting from the state's summative science assessment program that used items from the Shared Science Assessment Item Bank.

Nine alignment criteria, listed below, received major attention. These criteria were identified and confirmed through discussions with the state representatives who formed a collective decision-making body known as the Working Group.

1. **Use of Phenomena:** Each stand-alone item and item cluster is expected to be grounded in a stimulus that meets the test development criteria for a phenomenon. Items and item clusters are expected to require students to engage multiple dimensions of the PEs (“use science”) to make sense of those phenomena.
2. **Categorical Concurrence:** Test events are expected to yield sufficient evidence to make inferences about student knowledge, skills, and abilities (KSAs) as relates to each reporting category.
3. **Dimensionality (Structure of Knowledge):** All item clusters are expected to require students to demonstrate integrated engagement with the three dimensions of Science and Engineering Practices (SEPs), Disciplinary Core Ideas (DCIs), and Crosscutting Concepts (CCCs) specified in the targeted PE. All stand-alone items are expected to require students to demonstrate integrated engagement with two or three of the dimensions specified in the targeted PE.
4. **Consistency of Cognitive Engagement:** The assessment is expected to elicit work that is as cognitively demanding as the expectations in the PEs.
5. **Range of Knowledge Correspondence (Individual):** Test events are expected to assess an appropriate breadth of the standards. For individual students, assessed PEs are sampled across topics within each reporting category.
6. **Range of Knowledge Correspondence (Population):** At least 90% of PEs within a grade band have the potential to be assessed across the student population. State-specific claims are consistent with aggregate data from all administered test events in the state in conjunction with results from an independent analysis of vendor metadata.
7. **Balance of Representation:** No PE is targeted more than once on any single test event.
8. **Relationship of Scoring Assertions with Student Interactions:** In aggregate, the scoring assertions for an item/item cluster appropriately represent the inferences about student knowledge, skills, and abilities that can be made based on successful interactions with an item/cluster.
9. **Relationship of Scoring Assertions with PEs:** In aggregate, the scoring assertions for an item/item cluster appropriately represent the three-dimensional expectations of the targeted PE.

Study results suggest that the overall Shared Science Assessment Item Bank for both elementary and middle grades had the capacity to fully meet all alignment criteria used in this study and itemized above. The Shared Science Assessment Item Bank for high school grades had the capacity to weakly meet the criterion of Range of Knowledge Correspondence (Population) and the capacity to fully meet all other alignment criteria used in this study and itemized above. The criteria of Categorical Concurrence, Range of Knowledge Correspondence (Individual), and Balance of Representation are addressed primarily in the state-specific reports, considering state-specific documentation, test events, and data. In general, full or acceptable alignment was found between the NGSS PEs and the assessment items and item clusters for all grade bands although specific items were identified that did not meet one or more expectations, and warrant revisions or removal (details provided within the Findings section).

The only alignment weakness identified for the overall item bank was that the high school item pool did not meet states' expectations to have the capacity to address at least 90% of the corresponding PEs. This issue could be fully resolved with the addition of at least six items to the high school item bank. At least five of these items would need to address unrepresented PEs within the Physical Science domain.

Even for items that panelists agreed met alignment expectations, many editorial suggestions were made to correct errors found in text and graphics, improve clarity, and/or address scientific inaccuracy. This extent of editorial issues is typically not observed in an operational assessment and included many issues that could potentially affect student scores. Overall, however, panelists found that items and item clusters were meeting state expectations for assessment tasks to require integrated engagement with at least two (stand-alone items) or three (item clusters) dimensions of SEPs, DCIs, and CCCs specified in the targeted PE in order to make sense of a phenomenon. With just a very few exceptions, items required student cognitive engagement consistent with the expectations of the standards. With the sole exception of the high school item pool for Physical Science, one or more item(s) or item cluster(s) represented all, or all but one or two, PEs within each grade band and domain. Item were spread across the domains of Physical, Life, and Earth and Space Science, with no PE(s) overemphasized in the item bank. Overall, panelists found that the large majority of scoring assertions reasonably reflected inferences that could be made based on student interactions and corresponded to the expectations within the targeted PE. One panelist summarized "Overall, the items seem strong and do a commendable job of assessing proficiency as it relates to the 3D standards."
